

Timer/Counter/ Analyzers

PM6681, PM6681R & PM6681R/676/AF

Service Manual

FLUKE®

4822 872 20116
June 2003 Second Edition

Fluke grants permission for the U. S. Government to reproduce copies of this manual, on the condition that the legend "Reproduced with Permission" be legibly displayed on the copies. This material is not for resale. It is limited to Government use only and cannot be copied for any other purpose.

GENERAL INFORMATION

This manual contains directions for use that apply to a number of models. In order to simplify references to certain models, the following designation system is used throughout the manual:

PM6681 stands for PM6681, PM6681R and PM6681R/676/AF

PM6681R stands for PM6681R and PM6681R/676/AF

The PM6681R/676/AF is a model supplied with the following features:

- PM6681R base model
- Prescaler PM9624 (2.7 GHz)
- Rackmount kit PM9622
- Reference output option PM9671B

Refer to the respective type numbers in the Operators Manual for specifications and other information not found in this manual.

New options and deviations from the original design are collectively treated in Chapter 9, Appendix. Below is a summary of the changes:

Unit 1

The main printed-circuit board (Unit 1) has recently been redesigned due to obsolescence of a number of integrated circuits. Designations found in circuit descriptions, schematic diagrams and parts lists in the first eight chapters refer to the original design. The functional descriptions are correct on the whole, if you make a few substitutions. A new set of schematic diagrams and a new replacement parts list are added in Chapter 9, Appendix.

- Instruments having serial numbers >784919 belong to the new generation.
- The model PM6681R/676/AF has only been produced with the new Unit 1 board, so the serial number is irrelevant.

Model PM6681R

The model PM6681R introduces an ultra-stable rubidium atomic clock reference.

Option PM9671B

Reference output unit offering six buffered 1 V_{rms} outputs with four different standard frequencies: 3 x 10 MHz, 1 x 5 MHz, 1 x 1 MHz and 1 x 0.1 MHz.

New OCXOs

The PM9691 has been redesigned, and a version with very high stability , the PM9692, has been introduced.

This page is intentionally left blank.

Chapter 1

Safety Instructions

WARNING: These servicing instructions are for use by qualified personnel only. To reduce the risk of electric shock, do not perform any servicing other than that specified in the Operating Manual unless you are fully qualified to do so.

Authorized service and calibration of this instrument is available worldwide. A list of service centers is printed on the last page of this manual.

Read this chapter carefully before you check, adjust or repair an instrument.

Caution and Warning Statements

You will find specific warning and caution statements where necessary throughout the manual.

CAUTION: Indicates where incorrect operating procedures can cause damage to, or destruction of, equipment or other property.

WARNING: Indicates a potential danger that requires correct procedures or practices in order to prevent personal injury.

This Timer/Counter has been designed and tested in accordance with safety class 1 requirements for Electronic Measuring Apparatus of IEC publication 1010-1, and CSA C22.2 No.231, and has been supplied in a safe condition.

This manual contains information and warnings that should be followed by the user and the service technician to ensure safe operation and repair in order to keep the instrument in a safe condition.

WARNING: The opening of covers or removal of parts, except those to which access can be gained by hand, is likely to expose live parts and accessible terminals which can cause death.

The instrument must be disconnected from all voltage sources before it is opened. Remember that the capacitors inside the instrument retain their charge even if the instrument has been disconnected from all voltage sources.

Grounding

This instrument is connected to ground via a sealed three-core power cable, which must be plugged into socket outlets with protective ground contacts. No other method of grounding is permitted for this instrument.

The ground symbol on the rear panel indicates where the protective ground lead is connected inside the instrument. Never remove or loosen this screw.

When the instrument is brought from a cold to a warm environment, condensation may cause hazardous conditions. Therefore, ensure that the grounding requirements are strictly met.

Power extension cables must always have a protective ground conductor.

Indicates that the operator should consult the manual.

WARNING: Any interruption of the protecti-

ve ground conductor inside or outside the instrument, or disconnection of the protective ground terminal, is likely to make the instrument dangerous. Do not intentionally disrupt the protective grounding.

Disposal of Hazardous Materials

WARNING: Disposal of lithium batteries requires special attention. Do not expose the batteries to heat or put them under extensive pressure. These measures may cause the batteries to explode.

A lithium battery is used to power the non volatile RAM in this instrument. Our world suffers from pollution, so don't throw batteries into your wastebasket. Return used batteries to your supplier or to the Philips or Fluke organization in your country.

Line Voltage

The Timer/Counter can be powered by any voltage between 90 and 265 VAC without any range switching. This makes it suitable for all nominal line voltages between 100 and 240 V.

• Replacing Components in Primary Circuits

Components that are important for the safety of this instrument may only be replaced by components obtained from your local Philips or Fluke organization. After exchange of the primary circuits, perform the safety inspection and tests, as described in Chapter 5, "Repair".

• Fuses

This instrument is protected by an ordinary 1.6 A slow blow fuse mounted inside the instrument. NEVER replace this fuse without first examining the Power Supply Unit.

Chapter 2

Performance Check

General Information

WARNING: Before turning on the instrument, ensure that it has been installed in accordance with the Installation Instructions outlined in Chapter 1 of the Operators Manual.

This performance procedure is intended to:

- Check the instrument's specification.
- Be used for incoming inspection to determine the acceptability of newly purchased instruments and recently recalibrated instruments.
- Check the necessity of re calibration after the specified recalibration intervals.

NOTE: The procedure does not check every facet of the instrument's calibration; rather, it is concerned primarily with those parts of the instrument which are essential for determining the function of the instrument.

It is not necessary to remove the cover of the instrument to perform this procedure.

If the test is started less than 20 minutes after turning on the instrument, results may be out of specification, due to insufficient warm-up time.

Required Test Equipment

Type of instrument	Required Specifications	Suggested Instrument
LF Synthesizer	Square; Sine up to 2 MHz	PM5193
Digital Multimeter	to 300 VAC & VDC	PM2518; Fluke 77
Power Splitter		PM9584/02
T-piece		PM9067; Y9107
Termination	50 Ω	PM9585; Y9103
Low pass filter	50 kHz	PM9665B/01
Reference oscillator	10MHz 1×10^{-8} for 01 to 04 oscillator 5MHz 1×10^{-10} for 05 osc.	Philips counter with calibrated PM9691 PM 6685R *)
HF signal generator	to 2.1 GHz for PM9621, 5 GHz for PM9624 & 25	Fluke 6062A Wiltron 6717B-20 *)
Pulse Generator	to 125 MHz	PM5786B;PM5781
Oscilloscope with probes	350 MHz	PM3295
Power Supply	min 40 VDC	PM2811/113, PE1537; PE1542
BNC-cables	5 to 7 cables	

Table 2-1 Recommended Test Equipment

*) This test equipment is needed if an option is installed.

Preparations

Power up your instruments at least 20 minutes before checking to let them reach normal operating temperature. Failure to do so may result in certain test steps not meeting equipment specifications.

Front Panel Controls

Power-On Test

At power-on the timer/counter performs an automatic self-test of the following:

- Microprocessor
- RAM
- ROM
- Measuring circuits

It also displays the GPIB address.

If there are any test failures, an error message is shown.

Internal Self-Tests

The built-in test programs from the power-on test can also be activated from the front panel as follows:

- Enter the Auxiliary Menu by pressing **AUX MENU**.
 - Select the test submenu by pressing **SELECT** up or down.
 - Enter the test menu by pressing the **ENTER** key.
- Selections for internal self-tests are:
- 1 TEST RO (ROM)
 - 2 TEST RA (RAM)
 - 3 TEST ASIC (Measuring Logic)
 - 4 TEST DISP (Display Test)
 - 5 TEST ALL (Test 1 to 4 in sequence)

Figure 2-1 Text on the display

- Use **SELECT/SET** to select TEST ALL, then press **ENTER**.
- If any fault is detected, an error message appears on the display and the program halts.
- If no faults are detected, the program returns to measuring mode.

Keyboard Test

This test verifies that the *timer/counter* responds when you press any key. To check the function behind the keys, see the tests further on in this chapter.

Press the keys as described in the left column and look on the display for the text, as described in the second column. Some keys change more text on the display than described here. The display text mentioned here is the text mostly associated with the selected key.

NOTE: For the instrument to respond correctly, this test must be carried out in sequence and you must start with the Preset setting.

Short Form Specification Test

Sensitivity and Frequency Range

- Press the **PRESET** key to set the *timer/counter* in the default setting.
- Select 50 Ω input impedance and Non AUTO, (X1).
- Connect a signal from a HF generator to a BNC power splitter.
- Connect the power splitter to your counter and an oscilloscope.
- Set input impedance to 50 Ω on the oscilloscope.
- Adjust the amplitude according to the following table. Read the level on the oscilloscope. The *timer/counter* should display the correct frequency.

Frequency MHz	Level			Pass/Fail	
	mV _{PP}	mV _{RMS}	dBm	Input A	Input B
1	57	20	-21		
50	57	20	-21		
100	57	20	-21		
200	85	30	-17		Channel-B 100MHz
250	113	40	-15		
300	170	60	-11		

Table 2-3 Sensitivity for A & B inputs at various frequencies

- Connect the signal to input B.
- Select 50 Ω input impedance and SWAP A ↔ B on the counter.
- Repeat the above measurements for input B.

Check VMAX/VMIN

Check DAC for trigger level settings.

- Set your *timer/counter* in default setting by pressing **PRESET**.
- Select DC coupling, 1 MΩ input impedance and VOLT A MAX/MIN, but do not connect any input signal.
- The counter should now indicate:
 $V_{MAX} = 0 \pm 0.004V$ and $V_{MIN} = 0 \pm 0.004V$.
- Connect a 4.00 V_{DC} level to channel A, using an external low pass filter on the input.
- The readings should be:
 $V_{MAX} = 4.000 \pm 0.044V$, $V_{MIN} = 4.000 \pm 0.044V$.
- Change the DC level to 40V.
- The counter should indicate:
 $V_{MAX} = 40.0 \pm 0.84V$, $V_{MIN} = 40.0 \pm 0.84V$.
- Repeat the measurement with inverted polarity.
- Press MATH and select (K*X+L)/M to change to V_{PP} measurements.
- Press **ENTER**.
- Connect a sinusoidal signal to channel A with an amplitude 4.00 V_{PP} and a frequency of 100 kHz.
- The indication should be $4.00 \pm 0.244V$.
- Change the amplitude to 18 V_{PP}.
- The display should read $18.0 \pm 1.84V$.
- Select SWAP A ↔ B, and connect the signal to channel B. Repeat the measurements for B as described above.

Trigger Indicators and Controls

NOTE: This test must be performed in the sequence given.

- Press the **PRESET** key to set the Timer/ Counter in the default setting.
- Select Non AUTO, X1 attenuation, and 1 MΩ input impedance for channel A.
- Connect the following signal to channel A:
Sine, 10 kHz, 0.9 V_{PP}, and + 0.50 V_{DC}.
- Verify that the three modes for the trigger indicator are working properly by changing the trigger level:
 - Press the **SET A** key and enter **1** via the keyboard, then verify by pressing **ENTER**. Check the trigger indicator according to Table 2-4.
 - Press the **SET A** key and enter **-1** via the keyboard, then verify by pressing **ENTER**. Check the trigger indicator according to Table 2-4.
 - Press the **SET A** key and enter **0** via the keyboard, then verify by pressing **ENTER**. Check the trigger indicator according to Table 2-4.

Manually set trigger level	Trigger indicator	Pass/Fail	
		Input A	Input B
+1 V	off		
-1 V	on		
0.0 V	blinking		

Table 2-4 Trigger indicator check

- Select SWAP A ↔ B, and AC coupling on channel B, and repeat the exercise for channel B.

Trigger level check

- Deselect SWAP A ↔ B, connect the generator to channel A and check the trigger settings and indicators according to Table 2-5.

Trigger setting	Trigger indicator	Pass/Fail	
		Input A	Input B
SET A = 0 V	blinking		
DC coupling	on		
SET A = 0.7 V	blinking		
50 Ω Impedance	off		
SET A = 0.2 V	blinking		
AC coupling & 1 MΩ Impedance	blinking		
X10 Attenuation	off		
SET A = 0.0 V	blinking		
X1 Attenuation	blinking		

Table 2-5 Trigger level check

- Select A ↔ B
- Connect the signal to channel B.
- Select AC coupling on channel B, and repeat the previous settings for channel B.
- Connect the signal to channel A.
- Only the trigger indicator for channel A should be blinking.
- Press **COM A**.
- Both indicators should be blinking.
- Connect the signal to channel B.
- No trigger indicator should be blinking.

Reference Oscillators

X-tal oscillators are affected by a number of external conditions like ambient temperature and supply voltage but also by ageing. Therefore it is hard to give limits for the allowed frequency deviation. The user himself must decide the limits depending on his application, and recalibrate the oscillator accordingly. See the Preventive Maintenance chapter.

Oscillator	Max temperature dependence	Max ageing month	Max ageing year
Standard, 01	± 100 Hz	± 5 Hz	± 50 Hz
PM 9678B, 02	± 10 Hz	± 1 Hz	± 5 Hz
PM 9690, 04	± 0.15 Hz	± 0.2 Hz	± 1 Hz
PM 9691, 05	± 0.05 Hz	± 0.1 Hz	± 0.75 Hz

Table 2-6 Deviation (for PM 9690 and PM 9691 after 48 hours warm up time)

To check the accuracy of the oscillator you must have a calibrated reference signal that is at least five times as stable as the oscillator that you are testing, see the following table. If you use a non 10 MHz reference, you can use the mathematics in PM 6681 to multiply the reading.

- Set the counter to default settings by pressing **PRESET**.
- Connect the reference to input A
- Check the readout against the accuracy requirements of your application.

• Acceptance Test

As an acceptance test the following table gives a worst case figure after 30 minutes warm up time. All deviations that can occur in a year are added together.

Oscillator	Frequency readout	Suitable reference	Pass /Fail
Standard, 01	10.00000000 MHz ± 150 Hz	PM 9678B	
PM 9678B, 02	10.00000000 MHz ± 15 Hz	PM 9690	
PM 9690, 04	10.00000000 MHz ± 2 Hz	PM 6685B	
PM 9691, 05	10.00000000 MHz ± 1 Hz	PM 6685B	

Table 2-7 Acceptance test for oscillators

Resolution Test

- Connect a pulse generator to a power splitter.
- Connect one side of the power splitter to the A input of the counter via a coaxial cable.
- Connect the other side of the power splitter to the B input of the counter.

Settings for the pulse generator:

- Amplitude = 1 Vpp, (high level +1V and low level 0V)
- Period approximately 1 μ s
- Duration = approximately 50 ns
- Rise time 2 ns

Settings for the timer/counter, after Preset:

- Function = Time A-B
- Single

- Press **STAT** key under PROCESS
- Press **SELECT** key until display show 'ST DEV'.
- Meas Time = 50 μ s
- A and B inputs:
 - 50 Ω input impedance
 - Non AUTO
 - Trigger level = 0.5V
 - DC coupling

The result should be (std dev) < 0.05⁻⁹ s.

Rear Input/Output

10 MHz OUT

- Connect an oscilloscope to the 10 MHz output on the rear of the counter. Use coaxial cable and 50 Ω termination.
- The output voltage is sine wave shaped and should be above 500 mV rms (1.4 V p-p).

GATE OPEN Output

- Set your *timer/counter* in Default setting by pressing the **PRESET**.
- Select CHECK, Non AUTO, and Meas Time = 5 ms.
- Connect the oscilloscope to the Gate Open output via a coaxial cable. Set the oscilloscope to 1ms/division.
- The Gate Monitor output should be a pulse similar to the Figure 2-2 .

1 Mohm: 50 ohm:
2.8 V > 1.4 V

< 0.4 V < 0.4 V

1ms/div.

Figure 2-2 Signal on gate open output

REFERENCE IN

- Set the counter to Default Setting by pressing **PRESET**.
- Connect EXT REF out from another counter to input A.
- Connect a 10 MHz ± 100 Hz, 200 mV rms, (0.57 V p-p) signal to EXT REF IN at the rear, terminated with 50 Ω .
- Select Ext Ref.
- The display should show 10 MHz.
- Change the input frequency to 5, 2, and 1 MHz respectively.
- The display should still show 10 MHz.

EXT ARM input

- Select non AUTO.
- Settings for pulse generator: single shot pulse, amplitude TTL = 0 - 2 V_{PP}, and duration = 10 ns.
- Connect a pulse generator to EXT ARM input.
- Press **START ARM** key.
- Press **SELECT** key until display shows 'POS', confirm with **ENTER** key three times.
- The counter does not measure.
- Apply one single pulse to EXT ARM input.
- The counter measures once and shows 10 MHz on the display.

TRIG LEVEL A&B Outputs

- Press the **PRESET** key, to set the *timer/counter* in the default setting.
- Connect a voltmeter to TRIG LEVEL A(B) OUT at the rear.
- Set the Trigger Level (SET A/B) on the front to the following values, and verify the voltmeter's readout:

SET A(B)	Readout	Pass/Fail	
		Input A	Input B
+ 5.00 V	+ 5 V ± 0.28V		
- 5.00 V	- 5 V ± 0.28V		
0.00 V	0 V ± 0.03V		

Table 2-8 Trigger level outputs check

Probe Comp View

- Press the **PRESET** key to set the *timer/counter* in default setting.

Figure 2-3 Adjustment of the counters probe.

- Select TIME A-B, non AUTO, X1 attenuation and DC coupling for both channels.
- Set the LF synthesizer to 2 kHz square wave and 8 V_{PP} amplitude.
- Connect synthesizer to Input A via a BNC-cable.
- Use an oscilloscope to check the signal at Probe Comp View, at the rear. The square wave will have the same step response and 4 V_{PP} amplitude.
- Select X10 attenuation.
- Check that the square wave is 2 kHz and 0.4 V_{PP}.
- Repeat this test for channel B.

Measuring Functions

Preparation for Check of Measuring Function:

- Press the **PRESET** key, to set the *timer/counter* in the default setting.
- Connect a 10 MHz sine wave signal with 2.0 V_{PP} amplitude to Input A.
- Select the following settings for the *timer/counter*:
- 50 Ω input impedance for A and B
- Non AUTO
- COM A
- Check that the *timer/counter* performs the correct measurement, by displaying the result as shown under the "Display" column in Table 2-9.

Table 2-9 Measuring functions check

1) Value depends on the symmetry of the signal.

2) Exact value depends on input signal.

3) If an C-option is installed.

Check on HOLD OFF function

Press PRESET on the *timer/counter*.

Select the following settings for the *timer/counter*:

- Press CHECK.
- Select PER A.
- The counter should show 10^{-9} s*.
- Select HOLD OFF.
- The counter should show 1^{-6} s*.
- Set the Hold off time to 500^{-9} s.
- The counter should show 500^{-9} s*.

* The LSD digits may vary.

Options

Check on Prescalers

To verify the specification of the HF inputs in the instrument, perform the measurements below.

• PM 9621

Required Test Equipment	Suggested instrument
HF signal generator	Fluke 6062A

Table 2-10 Test equipment for 1.3 GHz HF-input

- Connect the output of the signal generator to the HF input of the counter.
- Connect the 10 MHz REFERENCE OUT of the generator to the REFERENCE IN at the rear panel of the counter.

Setting for the *timer/counter* after Preset.

- Function = FREQ C.
- EXT REF.

Figure 2-4 Connect the output of the signal generator to the HF-input of the counter.

- Generate a sine wave in accordance with the corresponding table below.

Frequency	Amplitude		Pass/Fail
MHz	mV _{RMS}	dBm	
70-900	10	-27	
-1100	15	-23	
-1300	40	-15	

Table 2-11 Sensitivity of PM 9621

- Verify that the counter counts correctly. (The last digit will be unstable).

• PM 9624, PM 9625B, or PM 9625

Required Test Equipment	Suggested instrument
HF signal generator	Wiltron 6717B-20

Table 2-12 Test equipment for 2.7, 4.2, and 4.5 GHz HF-inputs

- Connect the output of the signal generator to the HF input of the counter.
- Connect the 10 MHz REFERENCE OUT of the generator to the REFERENCE IN at the rear panel of the counter.
- Setting for the *timer/counter* after Preset.
- Function = FREQ C.
- EXT REF.

Figure 2-5 Connect the output of the signal generator to the HF-input of the counter.

- Generate a sine wave in accordance with the corresponding tables below.

Frequency	Amplitude		Pass/Fail
MHz	mV _{RMS}	dBm	
100-300	20	-21	
-2500	10	-27	
-2700	20	-21	

Table 2-13 Sensitivity of PM 9624.

Frequency	Amplitude		Pass/Fail
MHz	mV _{RMS}	dBm	
150-300	20	-21	
-2200	10	-27	
-3500	15	-23.5	
-4200	25	-19	

Table 2-14 Sensitivity of PM 9625B.

Frequency	Amplitude		Pass/Fail
MHz	mV _{RMS}	dBm	
150-300	20	-21	
-2500	10	-27	
-3500	15	-23.5	
-4200	25	-19	
-4500	50	-13	

Table 2-15 Sensitivity of PM 9625.

- Verify that the counter counts correctly. (The last digit will be unstable).

Chapter 3

Disassembly

The terms in the following figure are used in all descriptions in this manual.

Figure 3-1 Terms used in this manual.

The PM 6681 is available with a number of options and accessories. The labels on the rear panel of the counter identify the options and accessories included. If there are no labels, the counter contains an uncompensated crystal oscillator and no options. The following labels exist:

PM 9611/81 Rear Panel Inputs

PM 9621 1.3 GHz HF input

PM 9624 2.7 GHz HF input

PM 9625 4.5 GHz HF input

PM 9678B TCXO

PM 9690 Oven Oscillator

PM 9691 Oven Oscillator

The location of these optional parts is illustrated in Fig. 3-2.

Figure 3-2 Location of the boards in the counter.

Removing the Cover

WARNING: Do not perform any internal service or adjustment of this instrument unless you are qualified to do so.

WARNING: When you remove the cover you will expose live parts and accessible terminals which can cause death.

WARNING: Although the power switch is in the off position, line voltage is present on the printed circuit board. Use extreme caution.

WARNING: Capacitors inside the instrument can hold their charge even if the instrument has been separated from all voltage sources.

- Make sure the power cord is disconnected from the counter.
- Turn the counter upside down.
- Loosen the screw (A) at the bottom and the two screws (B) in the rear feet.
- Grip the front panel and gently push at the rear.
- Pull the counter out of the cover.

Figure 3-3 Remove the screws and push out the counter from the cover.

Reinstalling the Cover

- Push the counter gently back in the cover.

NOTE: Be sure that the screen shielding on the front make contact to the cover.

- Turn it upside down
- Install the two screws (A) at the bottom.
- Install the two rear feet with the screws (B) to the rear panel.

Fan

- Disconnect the power cable.
- Remove the cover from the counter.
- Remove the two screws (**A**) and nuts (**B**) from the fan.
- Disconnect the fan cable from J18.
- When reinstalling the fan, be sure that the air-flow arrow on the fan points to the rear of the counter and that the black wire is oriented toward the power module.

Figure 3-4 The fan is fastened with four screws and nuts.

Figure 3-5 Removing the HF input.

PM 9678B TCXO

- Disconnect the power cable.
- Remove the cover of the counter.
- Remove the screw (**A**) holding the TCXO to the main pca from beneath.
- Lift the TCXO straight up.
- Make sure that the jumpers J12 and J15 are set in the correct position.
- When installing the TCXO, make sure that the connector pins fit exactly in the holes in the connector housing (**C**).

PM 9621, PM 9624 or PM 9625 HF Input

- Disconnect the power cable.
- Remove the cover from the counter.
- Disconnect the cable from the mini-coax connector (**A**) on the HF input.
- Press the clips (**B**) apart and lift the HF input pca straight up and out.
- When installing the HF input, make sure that the connector pins fit exactly in the holes in the connector housing (**C**).

Figure 3-6 Lift the TCXO straight up after removing the fastening screw.

PM 9690 or PM 9691 Oven Oscillator

- Disconnect the power cable.
- Remove the cover of the counter.
- Remove the screw (**A**) holding the oscillator to the main pca from beneath.
- Press the clip (**B**) gently to the front of the counter and lift the oscillator straight up.
- Make sure that the jumpers J12 and J15 are set in the correct position.
- When fitting the oscillator, make sure that the connector pins fit exactly in the holes in the connector housing.

Figure 3-7 A clip and a screw hold the oven oscillators in place.

Return used batteries to your supplier or to your local Fluke organization.

Exchange Procedure

- Remove the cover of the counter.
- Connect the counter to the line power but keep it switched off.
- Lift the metal clip and press the battery towards the front of the counter using a screwdriver.

Figure 3-8 Location of battery G1.

Reinstalling the Battery

The instrument will lose its stored programs and front panel settings when the battery is replaced if not connected to the line power.

WARNING: Disposal of lithium batteries requires special attention. Do not expose the batteries to heat or put them under extensive pressure. These measures may cause the batteries to explode.

- Clean the battery connectors with a cotton swab and alcohol.

NOTE: Do not touch the new battery with your hands to avoid self discharging.

- Insert a new battery between the metal clip and the plastic holder. You will find the ordering number in the Replacements Parts Chapter.
- Disconnect the power cable.
- Reinstall the cover to the counter.

Don't throw batteries in your wastebasket. Return used batteries to your supplier.

Chapter 4

Circuit Descriptions

Block Diagram Description

General

The PM 6681 Timer/Counter consists of three main units:

- Front unit
- Main board unit
- Rear panel unit

Several options can be added, these are:

- Prescalers (1.3 GHz PM 9621, 2.7 GHz PM 9624, 4.2 GHz PM 9625B, and 4.5 GHz PM 9625)
- Oscillators (TCXO PM 9678B and oven oscillators' PM 9690 and PM 9691)
- Rack mount adapter (PM 9622)
- Rear panel inputs (PM 9611/81)

The chassis of the counter consists of a front piece molded in aluminum, an aluminum rear panel, and three aluminum profiles that hold the front and rear panels together. This unit can be slid into the aluminum cover of the instrument.

The front unit contains all functions needed for the user communication. A flat cable connects the front unit to the main board unit, and the molded front-piece screws onto the two aluminum profiles.

Most functions, such as the following, are placed on the main board:

- Input amplifiers with trigger level circuits
- Power supply
- Measurement logic
- Microcomputer circuitry
- GPIB-bus
- Analog output
- External reference input
- External arming input

Some outputs, such as the TRIGGER LEVEL and PROBE COMPENSATION VIEW outputs are directly mounted on the main board.

The rear panel unit is an aluminum panel with a number of mounted connectors. Most of the connectors are soldered directly to the main board. The rear panel screws onto the two aluminum profiles.

NOTE: Simplified extractions from the Schematic diagrams are used in this chapter. For complete information, see Chapter 8, Schematic Diagrams.

Figure 4-1 Block diagram PM 6681.

Hardware Functional Description

Front Unit

LCD Drivers

Figure 4-2 Front panel LCD drivers.

The front unit is made of a molded aluminum front. The keypad is made of silicon rubber with screened carbon pads on a PC board that covers the total front. An LCD and four LED's are used as indicators. To show both the measurement result and the state indicators of the instrument setting a LCD is used. The LED's shows standby, gating, and triggering channel A and B.

It has 160 segments that are multiplexed with a ratio of 2:1. Two cascade coupled LCD drivers (U201 and U202) are used. A serial I²C bus connects the drivers to the μ-controller on the main board. R201 sets the clock frequency of the drivers to approximately 140 kHz. The VLCD pin is connected to GND on the main board.

A back-light is provided with the LCD. This is an LED array integrated to one component. It uses approximately 0.35 A and dissipates approximately 1.5 W.

Keyboard

Figure 4-22 Keyboard scanning.

The push buttons are connected in a matrix and the scanning signals H0 to H7 are coming from the main board. If a button is pressed and H0 to H7 is high, one of the output signals V0 to V7 will be high. V0 to V7 are also connected to an interrupt input, P0.7 on the μ-controller U6 via the AND gates U21 and U87. The LOCAL-PRESET button is not part of the scanning, but connected directly to the AND gates U21 and U87.

Three screws fix the front unit to the main board unit. A 40-pin flat cable electrical connects the front unit to the main board.

Main Board

Input Amplifier A

Input amplifiers A and B are two matched 300 MHz amplifier circuits: Channel A and channel B.

Channels A and B are identical except the 100-kHz filter in channel A, the switching circuitry for the separate/common modes, the B-channel delay line, and event delay output. The following description refers to channel A but is also valid for channel B, (see Figure 4-4).

Four main stages makes the input amplifier: Input stage, impedance converter stage, comparator stage and buffer stage.

• Input Stage

The input stage contains:

- 50 Ω/1 MΩ impedance selector
- 1X/10X attenuator
- AC/DC coupling
- Voltage limiter

50 Ω/1 MΩ impedance selector

Figure 4-3 Impedance selector, 1X/10X attenuator and AC/DC coupling.

Relay K2A select 50 Ω or 1 MΩ impedance mode. 50 Ω is selected via resistors R135 to R146 if the relay switch is

Figure 4-4 Input amplifier block diagram.

closed. 1 MΩ is selected if the switch is open, (see Figure 4-3). Depending on selected attenuation, the 1 MΩ input impedance is determined by different combination of resistors. Resistor network R7, R8, R22 to R24, and R92 determents the 1X attenuation. Together with 1X resistors R4 to R6 and R10 to R12 sets the impedance in 10X attenuation. The input capacitance in parallel with 1 MΩ is 15 pF. Resistor R92 immediately after the selector serves both as current limiter with the voltage limiter (see below) and as impedance matching resistor. This resistor also improves the V Standing Wave Ratio of the amplifier.

1X/10X attenuator

The 1X attenuator consists of the resistive low frequency divider, which reduces the input signal by a factor of 2.3. R7, R8, R22 to R24, and R92 forms the attenuator, (see Figure 4-3). The variable capacitor C40 and the parasitic capacitance forms the capacitive high frequency divider in parallel with R22 to R24.

Variable capacitor C40 adjusts the capacitive attenuator to the same attenuation as the resistive.

Resistors R4 to R6 and R10 to R12 forms the 10X attenuator. The variable capacitor C1 and the resistors R10 to R12 forms the capacitive divider. The parasitic capacitance is in parallel with resistor R10 to R12.

C432 set the 10X input capacitance equal to the 1X input capacitance.

AC/DC coupling

Relay K4A select AC/DC - coupling. In AC coupling relay K4A is open and the signal is fed through the AC capacitor C5, (see Figure 4-3). In DC coupling the relay K4A is closed and the AC capacitor C5 is short-circuited. To protect the relay contact the two resistors R20 and R21 serve as current limiters.

Voltage limiter

Figure 4-5 Voltage limiter.

A voltage limiter that protects the impedance converter against over voltage is placed between the AC/DC selector and the impedance converter, (see Figure 4-5). It consists of resistor R26, the diodes D18, D62, and D8 to clamp positive voltage. Resistor R25 plus the diodes D4, D5, and

D9 to clamp negative voltage. The clamp voltage is approximately 2.7 V at low frequency signals. At high frequency the clamp voltage rises to approximately 3.0 V.

• Impedance Converter Stage

The analog signal from the input stage is fed to an amplifier stage where split-band technique is used to get a good frequency response over a wide range, (see Figure 4-6). This means that the high frequency path of the signal is fed via a high impedance AC-coupled FET transistor stage. In parallel via a DC coupled feedback operational amplifier stage, the low frequency path is fed. The low frequency path handles frequencies up to approximately 5 kHz.

Through the FET, V1 gate the high frequency signal is fed. The high impedance at the gate is converted to a low impedance at the source. Common for both high frequency and low frequency path the source is connects to the HF-transistor V25.

To make the FET work well in its active region within the whole dynamic range, the FET-drain is supplied with +12 V via resistor R94.

Two resistors, R16 and R17 divides the low frequency signal before it is coupled to the input pin 2 of the operational amplifier U1. Resistors R14 and R15 at U1 pin 6, center the output swing, and capacitor C3 stabilizes the operational amplifier stage.

The low frequency path goes via the operational amplifier, the base and collector of the transistor V25. This point (collector of V25) is the common point for the high and low frequency paths of the input frequency.

Figure 4-6 Impedance converter.

A driver stage (V22), an output stage (V23), and a current generator (V26), forms an amplifier with high output current. This amplifier is used to get a linear output in the 100Ω load resistor R101 over a swing of 2 V.

From the output of this second amplifier stage, the signal goes back to the operational amplifier pin 3 via divider R27 to R29 and R167. Trim potentiometer R167 sets the gain of the low frequency path equal to the high frequency gain, (about 0.9). Capacitor C30 is connected to U1 pin 1 and 8 to achieve stable operation. The trim potentiometer R18 between pin 1 and 5 on U1 is used to adjust the offset voltage of the operational amplifier.

The channel A filter connected to the output of the second amplifier stage is a 100 kHz LC-filter. It consists of coil L1, and two capacitors, C29 and C41 in parallel. Two relay-contacts, K5A and K5B, controls the filter. The filter output is connected to the input of the comparator stage.

The output of the amplifier stage is also connected to the rear panel via the amplifier U95. By using this output called "PROBE COMPENSATION A" it is possible to compensate a probe connected to the counter. This voltage is also connected to an analog input in the μ -controller. This makes it possible for the μ -controller to get a quick knowledge about the input voltage.

• Comparator Stage

Figure 4-8 Comparator and buffer stages.

The comparator stage converts the analog signal from the impedance converter stage to a square wave, (see Figure 4-8). This circuit consists mainly of the high speed integrated comparator U3 and a separate trigger level circuit connected to the comparator at pin 8 via resistor R87.

A DC level in the range of approximately -2 V to $+2$ V are generated by the trigger level circuits, which are described later. This covers a dynamic range of 5 V since the input signal is divided by a factor of about 2.4 before it reaches the comparator.

The counter is provided with fixed hysteresis, i.e., it is not controllable via the front panel or GPIB.

• Buffer Stage

Before the signal is fed further into the ASIC OQ0502, U58 it has to be converted by the buffer stage, (see Figure 4-8). The negative ECL logic levels (~ -0.9 V to ~ -1.7 V) from U3 pins 2 and 3, are converted to a single-ended signal with positive ECL logic levels (~ 4.1 V to ~ 3.3 V).

The buffer is a differential amplifier consisting of the two transistors, V27 and V28 whose bases are fed differentially from the two comparator outputs. Resistor R63 sets the current in the stage. Resistors R66 and R67 serve as current limiters to stabilize the stage and the two collector resistors R64 and R65.

• Common B via A

Figure 4-7 Common B via A.

The output signal from V23/ V26 can also be fed to the B-channel comparator, (see Figure 4-7). This is done in Common B via A mode. Relay K9A and K9B connects the comparator inputs pin 7 (A) and 10 (B) in parallel. Simultaneously relay K9B disconnects the output signal from input B to the B-channel comparator. In separate mode, the relays connect the output signal from input B to B-channel comparator input pin 10 (K9B), and disconnect the signal from input A to the B-channel comparator pin 10 (K9A).

The resistors R101 and R118 set the impedance in the comparator stage to 100Ω .

Input Amplifier B

Input channel B is the same as input channel A with the following exceptions:

- The Common B via A switches, that connect the B-channel comparator to the input signal on channel A.
- The B-channel delay line.
- The B-channel has no lowpass filter.
- The B-channel has a special event-delay signal output to OQ0504, U56.

• Delay Line

Figure 4-9 Delay lines.

A line of approximately 65 cm is placed between the "B-channel comparator output" pins 15 and 16 and the buffer stage V33 and V4, (see Figure 4-9). This delay line is a

part of the circuit board. It should compensate for delays in OQ0502, U58.

• Event Delay

Also for use in the arming function, the inverse output from the buffer stage V4 of channel B is used, (see Figure 4-10). This signal called EVENT-DELAY, is connected to the OQ0504 circuit U56 via the transistor V12 and the IC, U47 which works as a multiplexer.

The EVENT-DELAY signal is also used by the HOLD-OFF logic when the input pulses should be counted, (see Counter circuits on page 11).

Figure 4-10 Event delay.

Calibration Circuits

U93 and a delay line on the PCA generates a xx ns long pulse, and feed it to channel B input on the counter IC, U56. This pulse is initiated by the μ -controller pulse CAL-TEST-PULSE.

Trigger Level Circuits

The trigger level circuits generate the trigger levels to the A and B inputs. The trigger level range is -5.1 V to $+5.1\text{ V}$ with a resolution of 1.25 mV . As the input amplifier attenuation is approximately about 2.4 times, the trigger level circuits generate a DC level that has the same attenuation. This means that the output of this circuit has a range of -2.2 V to $+2.2\text{ V}$ with a resolution of 0.5 mV . To get the high resolution, two 12-bit DACs are used. The supply voltages to the trigger level circuits are filtered to prevent noise from the digital circuitry to influence the trigger level, (see Figure 4-11).

The trigger level circuits consists of:

- Reference voltage circuit (2.5 V), (U86).
- Reference voltage inverter circuit (-2.5 V), (U59).
- A multiplexer to select positive or negative reference voltage and Full scale B or Full scale common B trimmers, (U60).
- Buffer circuits, (U61 and U62).
- Two Digital to Analog converters, (U63 and U64).
- Two current-to-voltage converters (U65 and U66). These circuits convert the current at the IOUT pins of the DACs to a voltage. This signal has a range of approximately -2.1 V to 2.1 V .
- Two output buffers and RC filters for the trigger level outputs on the rear panel. (U67).

Figure 4-11 Trigger level circuits.

Power Supply

• Primary Circuits

The power supply generates five regulated DC supply voltages to the counter. It also generates some other supply voltages for special purposes. The power supply block also contains the ON/STANDBY logic, (see Figure 4-12).

The main building-block of the power supply is the primary switch mode power circuits. A rectifier make a DC-voltage of the line power AC-voltage (90 V to 265 V), before it is fed to the switch circuits.

After a line-power filter in the power inlet, a fuse and an NTC-resistor protect the power supply. The fuse (F1) should only blow if a catastrophic error occurs on the primary side of the power supply. A short-circuit on the secondary side should not affect the primary side. To minimize the "current rush" to the capacitors at the connection of the power cord, an NTC-resistor (R337) is used. The resistance is 16Ω when the resistor is cold, but decrease to a few ohms when warmed up by the current. The AC voltage is rectified in the bridge rectifier D40 and filtered in C330. C181, C183, and C184 should suppress noise from D40. L20, C173, and C174 forms filters.

Figure 4-12 Power supply, primary circuits.

L39 and L40 prevent HF-noise from the switch circuitry to reach the line-power inlet.

R460 to R463, R467, and R468 gives the start up voltage to the control circuitry U91. U91 outputs a frequency of 120 kHz on OUT (pin 10) to the switch transistor V55. When the switch transistor has started U91 will be supplied from the transformer T1 pin 3 via the diodes D50A and D50B.

Every switch pulse causes a voltage drop over the resistors R471 to R473 and R558. This voltage feeds the SENSE input (pin 5) of the control circuit U91. When the voltage has reached the internal reference level in U91, the switch transistor V55 is turned off.

V60 is a blanking transistor that will compensate for high transients generated by the transformer T1.

The internal sawtooth generator RC (pin 7) in U91 is connected to the SENSE input via V57, to compensate for low load.

The regulated +5 V is sensed by U92 and adjusted by R446. The output of U92 is connected to the VF input (pin 3) of U91 via the opto coupler U90.

The VREF pin (pin 14) outputs a reference voltage of 5 V DC.

• Secondary Circuits

A voltage over the capacitor C373 is generated by the diodes D56A and D56B. This voltage is used to generate a power-failure interrupt, (NMI) to the μ -controller, when the line-power disappears, (see Figure 4-13).

From the module there are three DC voltages outputs. One of those is regulated (+5 V) and the others are unregulated. These voltages will vary with input line voltage, the current at +5 V, and at the unregulated voltages. The output, marked +15, will be 14.8 V to 21 V and the output ,marked -9, will be -12.5 V to -7.5 V. The outputs are filtered, HF-filtered by C176, C177, and C178 and LF-filtered by L19, L21, L22, C179, C329, and C333.

These three DC voltages are used to make the following five supply voltages in the counter:

+5 V

From the switch transformer T1 via D43 and regulated by V49 and U72..

-5.2 V

-9 V is regulated by V17, U73, and U74.

+12 VREG

+15 V is regulated to +12 V by U69.

+12 VREG is used for the optional oven oscillator and the STAND-BY indicator.

+12 V

+12REG V is switched on and off by +5 V via V18 and V48.

+7 V

U70 and U71 regulates +12 V to be +7 V.

The voltages for special purposes are:

+9 V

Used unregulated.

At stand-by, the regulated supply voltages except +12VREG are switched off. However some special voltages are not, because the oven oscillator should be on and the ON/STANDBY logic should function, therefore, the primary power circuits will never be switched off. PM 6681 has only a secondary power switch.

A relay (K1C) disconnects the load of the +5 V and -5.2 V at stand-by. Because the power circuits always must have a load on the regulated voltage, a bleeder resistor R349 is always connected to +5 V. At standby the counter only needs +12 V, and to get enough current of this voltage, a certain current of the regulated +5 V must be used.

+5 V controls the switching on/off of +12 V and +7 V. When +5 V is on, V48 conducts, and the base of V18 will be approximately +11 V and the transistor will conduct, i.e., +12 V will be on. If there is no +5 V, V48 will be off, and the base of V18 will be +12 V, thus blocking the +12 V.

The ON/STANDBY logic controls relay K1A, which operates as described above. J15 have three functions:

- | | |
|---------|---|
| Normal | K1A controlled by the ON/STANDBY logic. |
| Removed | K1A always open. |
| Ground | K1A always closed. |

Fan

The temperature is sensed by counter circuit U58 which outputs an analog signal to the µ-controller U6. The µ-controller also senses the temperature on the main PCA via

Figure 4-13 Power supply.

Figure 4-14 OQ0502 and OQ0504 block diagram.

the resistor R564 and then controls the fan via U99 and V62.

Counter Circuits

The PM 6681 measuring logic consists of two ASIC's: One high speed bipolar ECL circuit and one CMOS circuit. The bipolar SMTc, (U56) contains the measuring control functions, high speed counters and some analog parts used to increase the time resolution. The CMOS ASMTc, (U58) consists of two counter chains for the measurement and logic for measuring the expanded interpolator pulses. It also contains two programmable mono flip flops (100 ns resolution), an oscillator and an external reference input, (see Figure 4-16).

Interpolator

The bipolar circuit has a small analog part. This part increases the resolution in time and frequency measurements by means of an analog interpolator. An analog interpolator is basically a capacitor charged and discharged with different currents (ratio approximately 400). A small error pulse is extended with the ratio of these currents, (see Figure 4-14).

Figure 4-16 The interpolator expands the error pulse 400 times.

Using the standard clock frequency as a reference we can measure this new extended pulse length. There are two interpolators, one start and one stop interpolator. OQ0502, (U58) circuit includes the generation of the error pulse and the time expander. OQ0504, (U56) holds the measuring logic for the expanded pulse. The small error pulse is the time from the external trigger event to the second positive clock transition. Consequently, the error pulse is between 10 ns and 20 ns long. The extended pulse is approximately 3 to 7 μ s, (see Figure 4-15).

Figure 4-17 Measuring the expanded pulse in the OQ0504 and the external counter.

Very fast events can not be handled by the counter circuits. Therefor some external interpolator circuits have been added to the interpolator circuits located inside OQ0502, U58. The counter circuits, U39 and U41 are cloc-

ked with 100 MHz when the signals IPA and IPB are present. After the counter circuit the signal is fed to OQ0504, U56, to be measured.

Timing

The following timing diagram (Figure 4-17) shows a number of measurement signals for a frequency measurement of 11 periods. This measurement is started directly when reset is released. The measurement start can be controlled in a much more detailed manner. GET and arming delays (event or time) can be used to qualify the measurement start. Qualifying the stop can be done in the same advanced way. The basic method is to send a Measurement STOp (MSTO) signal to the circuits via the μ C interface. This signal cannot be viewed externally.

The length of IPA and IPB is not correctly viewed (approximately 3 to 7 s).

Figure 4-15 A number of measurement signals for a frequency measurements of 11 periods.

XCY (X carry) is the input signal divided by 8. YCY (Y carry) is the clock divided by 8 (12.5 MHz). These two signals will normally look like a burst signal of 12.5 MHz and the input signal divided by 8. The burst length is as long as the gate time. An OverFlow Warning message, OFLW is send to the OQ0502 circuit. This means that the counter chains in OQ0504 will soon overflow and that the start/stop logic should stop the measurement when possible.

Reset

The RESET signal is coupled as a ripple through chain. By this method the reset signal resets the whole measuring logic in a correct order. The reset chain starts at the RESET IN pin on OQ0504, ripples through the measuring logic of OQ0504 and comes out on RESET OUT. The RESET signal is clocked through a flip-flop by the 100MHz signal and is then connected to the RESET IN pin of OQ0502 and resets the measuring logic of OQ0502.

The TRA and TRB signals are directly controlling the trigger LED's on the front panel. C315 and C316 connected to TRAC and TRBC inputs control the blinking rate.

Arming Delay

The measuring logic also has a programmable delay with a resolution of 100 ns. This delay is used as arming delay and is generated in the OQ0504. It is triggered from OQ0502 by the signal ARDO (to SYN1 in OQ0504). Toget-

Figure 4-18 Oscillator circuits functional description.

her with the signal PD1 from OQ0504, the delayed signal is fed back to the ARDI input on OQ0502. Instead of a time delay, the delay can be programmed to an event delay. The EDC1 input of OQ0504 are therefore connected to the B input enabling, event delay for events on the B channel.

Hold-Off

A second programmable delay with a resolution of 10 ns is used as hold off. It is triggered from OQ0502 by the signal HOS. The counter U53 is loaded with a value and clocked with 100 MHz. When the counter has come to zero this information is sent to OQ0504, EDC2 and the circuits are reseted.

The delayed signal is fed back to the HOF input on OQ0502.

Gate Open

The signal GATO from OQ0502 gives a real time indication of the state of the measuring logic. Main gate open is indicated by a high level and main gate closed is indicated by a low level. V122 makes it possible to make the high level 1.4 V in 50Ω .

Divider

The signal from input A is divided by two during frequency A measurements by the divider U85. The reason for this is that the OQ0502 can not handle frequencies above 225 MHz.

To be able to measure frequency bursts also on input C the signal from the prescaler is divided by two by the other half of U85 before it enter the OQ0502..

Inputs

The signals A (A-channel), B (B-channel), C (prescaler signal), and E (rear panel external arming input) go to an input multiplexer in OQ0502. In OQ0502 the A and B inputs also have slope selections (positive edge and negative edge). R257 and C117 terminates the C signal.

External Arming

The rear panel input EXTERNAL ARMING is a DC-coupled TTL level input. R258 to R261 with D32 and D33 protects the input. V8 and V42 are a Schmitt-trigger with approximately 1.4 V threshold level. The external arming signal is connected to E input on OQ0502.

Burst

The signal HOS from OQ0502 are also used when measuring at bursts. The External Arming input is switched off by the signal HSO.4 from the μ -processor via V66 and V65. The HOS signal is then fed via V68 and V67 back to the OQ0502 input E.

All ECL-inputs in OQ0502 get their reference (VBB) from an external ECL-circuit U132.

The GET-signal from an optional GPIB-interface can control the start of the measurement.

Figure 4-19 External reference circuits.

Oscillator Circuits

• CPU oscillator

The µ-controller U6 works with 16 MHz. A 16 MHz crystal B1 is connected to the XTAL inputs of the µ-controller. This frequency is divided by two by the µ-controller and is used by the GPIB controller U78.

• Standard oscillator

The 10 MHz reference oscillator is used as a reference for the measuring logic, (see Figure 4-18).

For the internal oscillator, there are several optional oscillators to choose from. The uncompensated 01-oscillator is always mounted in the PM 6681. If a better oscillator is needed, it should be connected to the opt.osc connector P105. A TCXO PM 9678B, oven oscillator PM 9690, or oven oscillator PM 9691 can be mounted. If this is done the oscillator type jumpers J12 should be placed in the OPT position.

The 01-oscillator consists of a crystal B2, C107 to C109, R239, R240, and the trim capacitor C114. C114 adjusts the frequency.

If an optional oscillator is mounted, the 10 MHz signal is amplified in a two stage amplifier (V40 and V41).

• External Reference Input

The external reference input can handle frequencies in steps from 1 MHz to 10 MHz, (1, 1.111, 1.25, 1.4285, 1.6667, 2, 2.5, 3.3333, 5, & 10 MHz).

R276, R278, and D35 protect the input. U88 amplifies the signal and make nice pulses out of it. U37 generates short pulses which is then filtered in the crystal filter B5 to be 10 MHz, (see Figure 4-19).

It is possible to switch off the external reference signal with the signal DISABL-EXT-REF from the micro controller. A low level of this signal makes V61 conductive, and that forces a high ECL-level on the output of U98.

The selected reference is used as 10 MHz out. An amplifier stage, V9 transforms the square wave from U56 to a sine signal. This stage has $50\ \Omega$ driving capabilities.

• 100 MHz Frequency Multiplier

The 10 MHz reference signal is fed to the flip-flops U81, which generates short negative pulses, (see Figure 4-20). These pulses triggers the resonant circuit, L25, C414, tuned to 100 MHz. After the amplifier V20, the signal is again fed to a resonant circuit, L29, C346, tuned to 100 MHz. A 100 MHz filter B3 removes over- and undertones. this procedure is repeated to get a nice sine wave. U94 generates a square wave signal which is used directly by the external Interpolator counter and Hold-off circuits. The 100 MHz square wave is also converted to ECL levels by resistors R238, R266, and R432, and used by OQ0502 as reference.

Figure 4-20 100 MHz frequency multiplier.

Figure 4-21 Block diagram, PM 6681 logical circuits.

Logical Circuits

• Microcomputer Circuits including. I/O

The microcomputer in PM 6681 is an Intel 16-bit CMOS μcontroller 80C196KC16, U6. It is a fast micro controller, intended for controller applications, i.e., it has many I/O ports and other facilities to control and react on the external world. It contains 232 RAM-bytes, (see Figure 4-21).

The micro controller can operate in both 8 and 16-bits mode externally. Internally the micro controller uses 16-bits. The address and data-bus AD0 to AD15 is shared

(time multiplexed) between addresses and data. Therefore the address must be stored in an address-latch (U14 and U15) by using the signal ALE (pin 62).

If the surrounding circuits are slow compared to the micro controller, wait states must be issued. The ready-pin (pin 43) goes low to get wait states. When the micro controller communicates with the battery RAM, the GPIB-chip, the ASICs, and the trigger level circuits, wait states are automatically inserted.

The PROMs (U16 and U17) used is a 27H010, i.e., two 128K byte memories. The address mapping is done so we can only address 32K bytes directly. Bank switching is

used to be able to use all 128K bytes. The signal from U6 pin 21 and 22 controls that one quarter of the memory is used for the moment. At reset the first quarter is selected (U6 pin 21 and 22 goes high).

To be able to make a CRC-check of the contents of the PROM, the micro controller must be able to read the contents of the PROM as data.

The address and data bus AD0 to AD15 can be separated into two parts. By removing resistors R183 to R190, R209 to R212, and R221 to R224 you can separate the micro controller, the address latch and the PROM from all other circuits on the bus. By removing R225 to R232 you can separate the counter circuits and the GPIB controller from the AD-bus.

The micro controller communicates with the outer world by I/O circuits connected to the address and data bus AD0 - AD15. The WR (pin 40) and RD (pin 61) signals from U6 control the direction of information. These two signals, with the address decoding logic, produce "chip select" signals for the I/O circuits. The address decoding logic uses the A5 - A15 to produce chip select signals. Chip select signals are generated for:

- PROM, U16 and U17, and RAM, U9 to U13.
- The input amplifier relay driver U18, display scanning circuit U19 and U20, and the GPIB driver U78.
- The trigger level circuits U63, U64, and U60 and the counter circuits U56 and U58.

To show that the counter measures, a gate indicator is placed on the front panel. It is controlled from the micro controller U6 pin 28 via V54. The blinking of the LED is software controlled, and does not necessarily reflect the true state of the measuring hardware.

The RAM, U13 has battery backup. If the counter is ON or in STAND-BY, the +12VREG gives power to the RAM pin 28, via U7 and D30 to get +5 V. If the counter is not connected to the line power at all, the 3 V battery gives power to the RAM. The Schottky diode D31 isolates the battery and preserves power when +12VREG is present. When this happens pin 27 of the RAM is low, and the RAM goes to the power-down mode. At this point the RAM needs a 2 V supply voltage.

The version of the main PCA are identified by the resistors R524 and R525. This DC voltage are fed into the analog input ACH0 of the µ-controller U6, which recognizes the board. This makes it possible to make the software backward compatible.

The different prescalers are identified in a similar way. R192 to R194 and R203 to R204 forms a resistor network that generates different DC voltages at the ACH1 input of the µ-controller. This DC voltage depends of how the pins 12, 14, and 16 on P20 are connected to ground and +5 V on the prescalers.

• Reset Circuit

A special reset circuit is included in the design. U8 is a special supply supervisor. If the +5 V becomes lower than 4.5 V, the reset output pin 4 goes low. This gives a micro controller reset. For test purposes the micro controller can be forced to reset by short circuiting the pads J10. The length of the reset pulse is set by C310; 2.2 µF gives a pul-

se of approximately 40 ms. The supervisor circuit also controls the reset pulse during the power-on, so the micro controller starts in a controlled manner.

• Keyboard Scanning

Figure 4-22 Keyboard scanning.

All outputs of U19 are set low one after the other. If no button is pressed, all outputs to the latch U20 are high and so are the inputs to the AND gates U21 and U87, (see Figure 4-22).

When a button is pressed, one input on the AND gates will go low. An interrupt is generated to the µ-controller U6 pin P0.7. The µ-controller reads the latch U20, and the program jumps to a special handler in the SW.

The ON button are connected to the ON/STANDBY logic in the power supply. When the counter is in STAND-BY the RESET input (pin 10) of U76 is kept high and so are the outputs of U76. A press on the ON key will discharge the capacitor C180 via the diode D24, the ON switch and the resistor R337 to ground. Pin 5 on U76 will go high making the transistor V52 active and the relay K1 will draw. Further more a short pulse is generated at V7 telling the µ-controller that the ON button have been pressed. This makes it possible to sense the difference between plugging in the line power cable or pressing the ON button.

When STAND-BY is pressed the µ-controller sets the flip-flop U76 by the signal SET-STANDBY and the relay K1 will fall.

The LOCAL/PRESET button are connected directly to the AND gates U21 and U87.

The STAND-BY indicator on the front panel is controlled by the +5 V, via V51. +5 V off lights the STAND-BY LED.

GPIB Interface

Figure 4-23 GPIB interface.

The GPIB interface controls the communication between the internal microprocessor and the external GPIB bus, (see Figure 4-23).

Communication between the GPIB control circuit, U78, and the external GPIB bus is done via the bi-directional bus drivers U79 and U80. U78 is controlled from the microprocessor by writing and reading in the internal control registers. If U78 has a message for the microprocessor, it uses the GPIB interrupt signal. The address of the GPIB bus is software controlled.

U9 to U13 are the RAM used to execute the program. U14 and U15 are address latches.

Analog Output

Figure 4-24 Analog output.

The result on the display can be converted to an analog signal. A digital pulse width modulated signal, PWM, from the microprocessor is filtered and integrated (U77) to give an analog DC level between 0 and 4.98 V with a resolution of 20 mV, (see Figure 4-24).

Rear Panel Unit

The rear panel consists of an aluminum panel with some mounted connectors, (see Figure 4-25). The following connectors are mounted on the rear panel:

INPUTS:

- External reference input - BNC (D)
- External arming input - BNC (E)
- Rear panel inputs (factory-mounted option)

OUTPUTS:

- Internal reference output - BNC (G)
- Gate open output - BNC (H)
- Analog output (X).
- Probe compensation output.
- Trigger level output.

- A GPIB communication connector.

Figure 4-25 Rear panel.

Optional Units

HF Inputs

There is a choice of three different optional HF inputs; PM 9621, PM 9624, and PM 9625. The inputs are all mounted on the same place on the main board, to the right of the input amplifier. They are connected to P107, and only one prescaler at a time can be mounted. In BU7 there are 3 ID pins. Different prescalers have different coding of these pins. PM 9624 and PM 9625 are factory repair only, due to the need of instrumentation for high frequencies.

• Prescaler 1.3 GHz, PM 9621

Figure 4-26 PM 9621 Block diagram.

The frequency range for the prescaler is 70 MHz to 1.3 GHz. To be able to be handled by the measuring logic in the counter the frequency is divided by 256. The input is AC-coupled and the input impedance is 50Ω nominal. Five main blocks makes the prescaler: Limiter, amplifier, divider, ECL output, and level detector, (see Figure 4-26).

Limiter

Figure 4-27 Limiter circuits.

The 6 dB attenuator (R1 to R11) keeps the VSWR low for all input levels, even the PIN diodes have low impedance, (see Figure 4-27). When the peak-to-peak level of the input signal is greater than the sum of the voltage drops of the Schottky diodes GR3 and GR4, the charging of capacitor C4 starts. Capacitor C4 filters the voltage after the Schottky diodes. The PIN diodes GR11 start to conduct when the voltage is lower than approximately -0.65 V.

More current through the diodes means lower impedance. This means that the HF voltage over GR11 is constant. R12 discharges C4 then the input level decreases. L1 prevents capacitor C4 from short-circuiting the HF signal.

Amplifier

Figure 4-28 Amplifier circuits.

R13, R14, and R15 attenuate the HF signal 3 dB, to prevent overloading of the amplifier circuit IC1. IC1 amplifies the HF signal approximately 15 dB. TS1 amplifies the frequency range 0.9 to 1.4 GHz by 8 dB, to increase the level for these frequencies due to the falling frequency response of IC2. TS2 is an impedance converter, (see Figure 4-28).

Divider

Figure 4-29 Divider and ECL-converter circuits.

The divider IC, IC2, divides the input frequency by 256. The output frequency is max. 5.5 MHz, (see Figure 4-29).

ECL output

TS3 and TS4 convert the output signal from IC2 to ECL levels. The rise and fall time of the output signal must be shortened. This is done in the differential amplifier TS5 and TS6. TS7 restores the ECL levels and buffers the single ended output signal, (see Figure 4-29).

Level detector

Figure 4-30 Level detector.

C13, C16, and L6 form a filter making the frequency response of the signal to the level detector diode GR7, the same as the signal to IC2, (see Figure 4-30).

The detector voltage is filtered and fed to IC3. Diode GR15 prevents the level from being too negative (IC3 is then locked). The first stage in IC3 amplifies the level approximately 15 times and the second stage is a Schmitt trigger. The output from the Schmitt trigger can block, via TS8, the ECL output signal. A low output signal from IC3 pin 7 makes TS8 conduct. The ECL output signal will be 4.5 V. If IC3 pin 7 is high, TS8 is not conducting, and the output signal from TS7 is not blocked. The Schmitt trigger is controlled from the first amplifier in IC3. If the level on IC3 pin 3 (detected level) is lower than the reference level on IC3 pin 2 (an HF signal with sufficient level present), IC3 pin 1 is low and the Schmitt trigger output is high, thus not blocking the ECL output signal. The reference level on IC3 pin 2 is set by trim-potentiometer R30. GR8, GR9, and R28 form a temperature compensation circuit, to compensate for the temperature behavior of the detector diode GR7. For testing purposes, the level detection can be overruled by the signal TEST GO. A high level makes TS10 conduct, and that enables the ECL output signal, despite the HF input signal amplitude. The ECL output signal can also be switched off, despite the level detection. A high level on signal NOT C makes TS9 conduct and thus makes the level to TS8 low. TS8 makes the ECL output signal +4.5 V.

• Prescaler 2.7 GHz, PM 9624

Figure 4-31 PM 9624 Block diagram.

The PM 9624 prescaler cannot be repaired at a local workshop. It must be sent to the factory for repair.

The prescaler consists of the following parts, (see Figure 4-31):

Limiter

- The limiter consists of a 6 dB attenuator and a PIN diode attenuator, to achieve constant input amplitude to the amplifiers.

Amplifier

- Five amplifier stages are divided into three blocks. One block consists of one amplifier. Two blocks consists of two amplifiers each and an AGC control.

Automatic Gain Control (AGC)

- Helps the amplifiers to retain a constant output amplitude.

Dividers

- Two dividers divide the input signal frequency by 16.

Detector

- Detects whether the level of the input signal is high enough to ensure correct measurement and, if not, blocks the output signal from the prescaler.

Positive Voltage Regulator

- Positive voltage supply for the amplifiers.

- *Prescaler 4.5 GHz, PM 9625*

Figure 4-32 PM 9625 Block diagram.

The PM 9625 prescaler cannot be repaired at a local workshop. It must be sent to the factory for repair.

The prescaler consists of the following parts, (see Figure 4-32):

Limiter

- The limiter consists of a 6 dB attenuator and a PIN diode attenuator, to achieve constant input amplitude to the amplifiers.

Amplifier

- The amplifier consists of 4 cascade coupled integrated GaAs amplifiers; each amplifies approximately 8 dB.

First divider

- The GaAs divider chip consists of an input buffer, 3 divider stages, and 2 output buffer stages. The circuit divides by 8.

Second divider

- This divider divides the signal from the first divider by 4. In total the frequency is divided by 32, and the output frequency from the prescaler is 155 MHz at maximum.

Voltage regulators

- Two positive voltage regulators are used for the GaAs amplifier and the first divider.

Test Routines

Test Routines via AUX MENU Key

The test routines are the routines accessible via the aux menu key.

Refer to the PM 6681 Operators Manual.

Power-On Tests

At power on, some tests are automatically performed. Simultaneously a message is sent to the serial port of the μ -computer. The message can be read by a PC connected to the serial port. To do this perform as follows:

- Connect testpoints P5=OUT and P16=GND to a COM port on the PC.
- Run a terminal emulator program as KERMIT or Windows TERMINAL EMULATOR.

Switch on the counter.

Every time the counter is switched on the following message will be displayed on the screen:

Code start OK
Ram regs OK
Timer1 OK
Prom bank3 OK
Prom bank2 OK
Prom bank1 OK
Prom bank0 OK

Chapter 5

Repair

Preventive Maintenance

Calibration

To maintain performance of PM 6681 we recommend that you calibrate your instrument every year, or more often, if greater time base accuracy is required. Calibration should be performed with traceable references and instruments at a certified calibration laboratory. Contact your local Fluke service center for calibration.

To know the present status of your instrument, test your timer/counter from time to time. The test can be made according to the information in Chapter 2, Performance Check.

Oscillators

The frequency of the reference crystal oscillator is the main parameter affecting accuracy in a counter. The frequency is affected by external conditions like the ambient temperature and supply voltage, but also by aging. When recalibrating, the reference crystal oscillator is compensated only for deviation in frequency due to aging.

• Some important points:

- The high stability oscillators have been built into an oven in order to keep the oscillator temperature as stable as possible. Continuous operation is also important for stability. After a power interruption, the oscillator restarts at a slightly different frequency. It will then, as time goes on, age at an equal rate.
- The stability indicated for the oscillators is valid within a temperature range of 0 to 50°C, with a reference temperature of 23°C. If the timer/counter is used in a room temperature of 20 to 30°C, the temperature stability of a TCXO or OCXO will be increased by a factor of 3.
- The temperature stability indicated for TCXO and standard oscillators are mainly dependent on the ambient temperature. When operating there is always a temperature increase inside the counter which will influence the oscillator.

• Recalibration intervals

The Mean Time Between ReCalibration, MTBRC, is defined as:

$$MTBRC = \frac{(Acceptable\ error) - (Temperature\ stability)}{(Aging)}$$

MTBRC can be calculated when the total acceptable error and the oscillator specifications are known.

The total acceptable error is defined as:

$$(Acceptable\ error) = \frac{(Deviation\ of\ reference\ frequency)}{(Nominal\ frequency\ reference)}$$

Example:

- A user can accept a maximum of 3 Hz deviation on the 10 MHz frequency of the oscillator. This results in:

$$(Acceptable\ error) = \frac{3}{10 \cdot 10^6} = 3 \cdot 10^{-7}$$

The aging and temperature factors can be selected from the table on page 5-3.

The value of the aging factor is correctly selected from the table when the calculation of MTBRC results in 1 to 30 days (use /24h), 1 to 12 months (use /month) or over 1 year (use /year) (not, e.g., 43 days or 17 months or 0.8 years).

Example:

- The user has the same requirements as in the example above. The counter has a PM 9690 oscillator.
- Look up information about PM 9690 in the table on page 5-3. The results will be the following:

Relative Frequency deviation caused by:

- Ambient temperature deviation
(within 0 to 50°C; reference point at 23°C): Less than $1.5 \cdot 10^{-8}$
- Aging/year: Less than $1 \cdot 10^{-7}$
- Use the MTBRC formula with the above values. This gives a MTBRC of maximum:

$$\frac{(3 \cdot 10^{-7}) - (1.5 \cdot 10^{-8})}{1 \cdot 10^{-7}} = 2.9 \text{ year}$$

See also Figure 5-1, Figure 5-2, and Figure 5-3.

Figure 5-1 MTBRC in days.

Figure 5-2 MTBRC in months.

Figure 5-3 MTBRC in years.

NOTE: When recalibrating, the reference crystal oscillator will be compensated only for frequency deviation caused by aging.

Stability against	Model Options			
	/1.	/2.	/4.	/5.
	Standard	TCXO	Oven	Oven
Aging: /24h	n.a.	n.a.	$<1 * 10^{-9}$ *	$<5 * 10^{-10}$ *
Aging: /month	$<5 * 10^{-7}$	$<1 * 10^{-7}$	$<2 * 10^{-8}$	$<1 * 10^{-8}$
Aging: /year	$<5 * 10^{-6}$	$<5 * 10^{-7}$	$<1 * 10^{-7}$	$<7.5 * 10^{-8}$
Temperature: 0 to 50°C ref. to + 23°C	$<1 * 10^{-5}$	$<1 * 10^{-6}$	$<1.5 * 10^{-8}$	$<5 * 10^{-9}$
Line Voltage $\pm 10\%$	$<1 * 10^{-8}$	$<1 * 10^{-9}$	$<5 * 10^{-10}$	$<5 * 10^{-10}$
Warm-up Time to Reach 10^{-7} of Final Value	n.a.	n.a.	< 15 min	< 15 min

Table 5-1

* after 48 hours of continuous operation

Battery Replacement

To preserve data and variables needed for the use of PM 6681 a lithium battery is included. The lithium battery has an estimated lifetime of five to ten years. We recommend replacing the battery every five years to avoid loss of data in operation.

When battery is empty, the timer/counter will lose all settings, and any data in memory, if disconnected from line power.

See "Reinstalling the Battery" on page 3-4.

Troubleshooting

General

Quick Troubleshooting

The PM 6681 is a highly integrated Timer/Counter with dedicated LSI counter circuits and microcontrollers that control the complete units. The microcontroller can help you to locate faulty parts by running test programs and generating stable signal patterns on the bus. If the microcontroller does not work or the fault is in a part of the counter that cannot be accessed by the microcontroller, traditional fault-finding must be performed.

Where to Start

After reading the safety instructions, continue with this Chapter for faultfinding and repair instructions. When you have fixed the instrument, always do the Safety Inspection and Test after Repair, as described later in this Chapter. Then do the checks in Chapter 2, Performance Check. Recalibrate if required by following the adjustment instructions in Chapter 6, Calibration Adjustments.

Logical Levels

The PM 6681 contains logic of four families. The levels for these families are listed in Table 5-2.

	Positive ECL	Negative ECL	CMOS	TTL
Supply voltage	+5 V	-5 V	+5 V	+5 V
Signal ground	0 V	0 V	0 V	0 V
Input voltage				
High, VIH	>+3.9 V	>-1.1 V	>+4 V	>+2 V
Low, Vil	<+3.5 V	<-1.5 V	<+1 V	<+0.8 V
Output voltage				
High, VOH	>+4 V	>-1 V	>+4.9 V	>+2.7 V
Low, VOL	<+3.3 V	<-1.7 V	<+0.05 V	<+0.4 V
Bias ref. voltage, VBB	+3.7 V	-1.3 V	-	-

Table 5-2 Logical levels.

Required Test Equipment

To be able to test the instrument properly using this manual you will need the equipment listed in Table 5-3. The list contains not only suggested Fluke test equipment, but also the critical parameter specifications required if you have instruments from other manufacturers.

Type	Performance	Model No
DMM	-	PM 2518 or 77
Oscilloscope	50 Mhz 2-channel	PM 3050
Signal generator	1300 MHz	6062A
BNC-BNC cables	-	-

Table 5-3 Required test equipment.

Operating Conditions

Power voltage must be in the range of 90 to 260 VAC.

Introduction

Figure 5-4 Functional levels.

The troubleshooting strategy in PM 6681, is an integrated part of the overall service strategy for the instrument. This instrument is hierarchically designed in different levels, see Figure 5-4, and troubleshooting can be performed in any design level if the lower levels are OK. It is therefore important to disconnect all options in the beginning of the troubleshooting procedure.

Running Test Programs

The service functions are activated by connecting the two solder points, labeled TEST, J11 during startup, see Figure 5-6.

Figure 5-6 The service functions are activated by connecting the two solder points, labeled TEST, J11 during startup.

- Switch on the counter.

The ROM test, RAM test, and µC Kernel test runs automatically. After the display test the test-program starts from the beginning again. Use LOCAL/PRESET to step through the different tests.

NOTE: The address test and display test are described under Level 4 and Level 5 respectively, but they cannot be run before you have checked Level 6.

Text	Function	Level	Exit
test r0	ROM test	3	Automatically
test rA	RAM test	3	Automatically
test Core	µC Kernel test	3+4	LOCAL/PRESET
test relay	Control signal test	5	LOCAL/PRESET
test buttn	Keyboard test	6	LOCAL/PRESET
test Addr.	Address test	4	LOCAL/PRESET
test ASIC	ASIC's test 1	7	Automatically
test ASIC	ASIC's test 2	7	LOCAL/PRESET
test dAC	DAC test	8	LOCAL/PRESET
test ANALO	Analog out test 1	10	LOCAL/PRESET
85	Analog out test 2	10	LOCAL/PRESET
8888888888	Display test	5	LOCAL/PRESET

Table 5-4 Test programs.

Troubleshooting Tree

Power Supply (Functional Level 1)

Figure 5-7 Test points and voltages for the power supply.

WARNING: Live parts and accessible terminals which can be dangerous to life are always exposed inside the unit when it is connected to the line power. Use extreme caution when handling, testing or adjusting the counter.

Primary circuits

To verify the Power supply proceed as follows:

- If the primary fuse is broken, there is a short circuit in the primary circuits. Use a DMM and try to locate the fault by resistance measuring.
- Remove the cover from the Power Supply.

WARNING: The heat sink inside the power supply is connected to the line power.

- Disconnect L39 and L40 and check the resistance between pin 1 and 4 on the transformer T1, see Figure 5-7. If the DMM show a short circuit the fault is probably a broken transistor V55. Put L39 and L40 back in position.
- Connect the counter to the line power via an insulating transformer with separate windings.
- Set the counter to STAND-BY mode.
- Check that the voltage between P19 and P23 is in the range of 90 to 260 VAC.
- Check that the DC voltage between pin 1 and 4 on T1 is about $\sqrt{2}$ times the input AC-voltage. If not, use traditional faultfinding techniques to locate the fault.
- Remove the jumper J15.
- Check the "STAND BY" voltages according to Table 5-5.

Test points	Ground	Voltage
U91 pin 11 & 12	U91 pin 8	+10 to +13.5 V
U91 pin 14	U91 pin 8	=+5.0 V
V55 source	U91 pin 8	=+10 mV
U90 pin 1	L41	=+8.2 V
U92 pin 1	L41	=+4.4 V
X10	L41	=+5.1 V
X11	L41	+14.8 V to +21 V
X12	L41	-12.5 V to -7.5 V
X13	L41	+12 V ±0.5 V

Table 5-5 Stand-by voltages.

- Reinstall the jumper J15.
- Check the curveforms according to Figure 5-8 and Figure 5-7 to verify the primary circuits. Use the heat-sink of V55 as ground.

Figure 5-8 Typical curves of the power supply.

NOTE: U91 and U92 are located at the bottom side of the PCA.

Secondary circuits

- Connect the power cable to the counter.
- Switch ON the counter.

CAUTION: If you adjust the +5 V trimmer you have to adjust the complete instrument.

- Check the "POWER ON" voltages according to Table 5-6. Use L41 as ground.

Test points	Voltage
X15	+5.01 V \pm 30 mV*
X16	-5.1 V \pm 50 mV
X14	+7 V \pm 100 mV
X17	+12 V \pm 100 mV

Table 5-6 Power-on voltages.

*NOTE: If the +5 V voltage is outside the specification, all other levels will be wrong, since they are based on the +5 V level.

If you find any fault, continue with traditional troubleshooting techniques and replace defective circuits. See also Chapter 4, Circuit Descriptions, Power Supply.

Oscillator (Functional Level 2)

Figure 5-9 Test points and jumper for testing the oscillators.

• Standard Oscillator

- Be sure that jumper J12 are in the STD position, see Figure 5-9.

- Check that 10 MHz is present at U56 pins 34, 35, 36 and pin 37.
- Check that 10 MHz is present at the rear panel connector 10 MHz OUT, J7.
- Check that 100 MHz is present at U58 pin 19. If you find any fault, continue with traditional troubleshooting techniques and replace defective circuits. See also Chapter 4, Circuit Descriptions, Oscillator Circuits.

• Optional Oscillator, PM 9678B

This test can be carried out only if the counter is equipped with an optional oscillator, PM 9678B.

- Be sure that jumper J12 are in the OPT position, see Figure 5-9.
- Check that 10 MHz is present at U56 pins 34, 35, 36 and pin 37.
- Check that 10 MHz is present at the rear panel connector 10 MHz OUT, J7.
- Check that 100 MHz is present at U58 pin 19. If you find any fault, continue with traditional troubleshooting techniques and replace defective circuits. See also Chapter 4, Circuit Descriptions, Optional Oscillator, PM 9678B.

• Optional Oscillator, PM 9690 and PM 9691

This test can be carried out only if the counter is equipped with an optional oscillator, PM 9690 or PM 9691.

- Be sure that jumper J12 are in the OPT position, see Figure 5-9.
- Check that 10 MHz is present at U56 pins 34, 35, 36 and pin 37.
- Check that 10 MHz is present at the rear panel connector 10 MHz OUT, J7.
- Check that 100 MHz is present at U58 pin 19. These oscillators cannot be repaired in a local workshop. They must be sent to the factory for repair.

Microcontroller (Functional Level 3)

Figure 5-10 Test points and jumpers for testing the microcontroller.

- Check that 16 MHz is present at U6 pin 67, see Figure 5-10.
 - Check that 8 MHz is present at P7.
 - Check that the RESET circuitry U8 works properly by short circuiting the above shown pads.
- At power on, some tests are automatically performed. Simultaneously a message is sent to the serial port of the μ -computer. The message can be read by a PC connected to the serial port. To do this perform as follows:
- Connect testpoints P5=OUT and P16=GND to a COM port on the PC.
 - Run a terminal emulator program as KERMIT or Windows TERMINAL EMULATOR.
 - Switch on the counter.

Every time the counter is switched on the following message will be displayed on the screen:

```

Code start OK

 PHILIPS, PM6681, 0, MAIN X1.02 Mar 24 1994 10:30:26 /
 GPIB X1.13 Mar 01 1994 123

Figure 5-11 Timing diagram for μ -controller.

- Run μ C Kernel test, Test 3.
- Set the oscilloscope to 0.2 V/div and 50 μ s/div.
- Check the output signals from the μ C, U6, see Figure 5-10. Use test pin P5 to trigger the oscilloscope.
- The timing diagram, Figure 5-11, shows the signals generated by the stimuli program.

If you find any fault, continue with traditional troubleshooting techniques and replace defective circuits. See also Chapter 4, Circuit Descriptions, Logical Circuits.

NOTE: Check that activity is going on at U6 pin 62 (ALE), U6 pin 61 (RD), U6 pin 63 (INST), U6 pin 40 (WR/WRL), U6 pin 41 (BME/WRH), and U6 pin 43 (READY). These pins should not be stuck to HIGH or LOW.

- If one or more bits on the AD-bus are corrupt, the μ C often reads the same instructions repeatedly. When the μ C discovers are invalid OP code, it will RESET itself and start from the beginning again. The μ C sets the RESET input low when it resets itself. This can be discovered at the RESET input of U6, (pin 16). If +5 V to U8 is OK, this could be the case.

Microcomputer Kernel (Functional Level 4a)

Set the oscilloscope to 2 V/div and 20 μ s/div.

- Run μ C Kernel test, Test 3.
- Check all signals on U9 to U13, U16 and U17. The signals should not be stuck high or low. Use test pin P5 to trigger the oscilloscope, see Figure 5-12.

NOTE: By removing R183 to R190, R209 to R212, and R221 to R224 the microcomputer kernel (AD0-AD15) can be separated from the rest of the counter logic.

NOTE: These resistors are located at the bottom side of the PCA.

If you find any fault, continue with traditional troubleshooting techniques and replace defective circuits. See also Chapter 4, Circuit Descriptions, Logical Circuits.

Figure 5-12 Pinning diagram for U9 to U16.

Microcomputer Kernel (Functional Level 4b)

NOTE: It is not possible to run this test before you have run the Keyboard test, Test 5.

- Set the oscilloscope to 2 V/div. on channel A and B.
- Set the time base to 0.5 μ s/div.
- Use pin 40 on U6 to trigger the oscilloscope.
- Run the Address test, Test 6.
- Enter the data code 85 (hex 55) on the DATA ENTRY keypad.
- Press ENTER.
- Enter the address code 43690 (hex AAAA) on the DATA ENTRY keypad.
- Press ENTER.
- Examine the DATA bus lines AD0-AD15 (U6 pin 45-60) with the probe connected to the A-channel, and compare the signal to with Figure 5-13.

The interesting part of the data bus signal is the grayed area on the figure.

- Press LOCAL/PRESET.
- Enter the data code 170 (hex AA) on the DATA ENTRY keypad.
- Press ENTER.
- Enter the address code 43690 (hex AAAA) on the DATA ENTRY keypad.
- Press ENTER.
- Examine the DATA bus lines.
- Press LOCAL/PRESET.
- Enter the data code 170 (hex AA) on the DATA ENTRY keypad.
- Press ENTER.
- Enter the address code 21845 (hex 5555) on the DATA ENTRY keypad.
- Press ENTER.
- Examine the DATA bus lines.
- Press LOCAL/PRESET.
- Enter the data code 85 (hex 55) on the DATA ENTRY keypad.
- Press ENTER.
- Enter the address code 21845 (hex 5555) on the DATA ENTRY keypad.
- Press ENTER.
- Examine the DATA bus lines.
- Press LOCAL/PRESET.

If you find any fault, continue with traditional troubleshooting techniques and replace defective circuits. See also Chapter 4, Circuit Descriptions, Logical Circuits.

CAUTION: Do not enter an address code between E000 and FFFF because this changes the status of the RAM, which has battery backup. This can cause irregular operation of the counter when in normal use.

Figure 5-13 Example of AD-bus line diagram.

Internal Control Signals and Display (Functional Level 5a)

Figure 5-14 Display driving signals and internal control signals can be measured here.

- Run the Control signal test, Test 4.
- Set the oscilloscope to 0.2 V/div and 50 μ s/div.
- Check the output signals of U18, see Figure 5-14. Use test pin P5 to trigger the oscilloscope.

NOTE: U18 is located at the bottom side of the PCA.

Figure 5-15 Timing diagram for Control signals.

- The timing diagram in Figure 5-15 shows the signals generated by the stimuli program.
- If you find any fault, continue with traditional troubleshooting techniques and replace defective circuits. See also Chapter 4, Circuit Descriptions, Logical Circuits.

Figure 5-16 Display readout, test 12.

Internal Control Signals and Display (Functional Level 5b)

**NOTE: It is not possible to run this test before you have run
Keyboard test, Level 6.**

- Run DISPLAY test, Test 12.
 - Check the validity of the display readout according to Figure 5-16.

Keyboard (Functional Level 6)

- Run the Keyboard test, Test 5.
 - Press a pushbutton on the front panel and check that the displayed code are as in the Figure 5-17.

NOTE: The STAND BY/ON and LOCAL/PRESET pushbuttons cannot be tested with this tool.

If you find any fault, continue with traditional troubleshooting techniques and replace defective circuits. See also Chapter 4, Circuit Descriptions, Front Unit, and Keyboard Scanning.

Figure 5-17 Codes for each key, Test 5.

Measuring Logic (Functional Level 7)

- ASIC Stimuli

Figure 5-19 Pinning diagram for U56 and U58.

- Run the ASIC tests, Test 7 and 8.
- NOTE: Test 6 runs automatically without stimuli signals.*
- Set the oscilloscope to 2 V/div and 50 μ s/div.
 - Check all signals on U56 and U58. Use P5 to trigger the oscilloscope, see Figure 5-19.

Figure 5-18 Timing diagram for ASIC stimuli test program.

- The timing diagram in Figure 5-18 shows the signals generated by the stimuli program.

If you find any fault, continue with traditional troubleshooting techniques and replace defective circuits. See also Chapter 4, Circuit Descriptions, Counter Circuits.

The following tests should be done with the standard PROM installed in the counter.

- Switch on the counter.
- Connect an arbitrary signal to the EXT ARM input, J5 at the rear panel.
- Trace the signal from J5 to U58 pin 27.
- Connect a 10 MHz signal to the REFERENCE IN input, J6 at the rear panel.
- Trace the signal from J6 to U56 pin 38.
- Select EXT REF.
- Trace the signal from U56 pin 35 to the 10 MHz OUT, J7 at the rear panel.
- Trace the signal from U58 pin 41 to GATE OPEN output, J4 at the rear panel.
- Trace the signal from U58 pin 37 and 38 to J17 pin 30 and 34 at the front panel and to the display and keyboard board.

If you find any fault, replace the defective circuits. See also Chapter 4, Circuit Descriptions, Counter Circuits.

Trigger Level DAC's (Functional Level 8)

Figure 5-20 Trigger level DACs, U63 and U64.

- Run the DAC test, Test 9.
- Use test pin P5 to trigger the oscilloscope.

Figure 5-21 Timing diagram for Trigger level DAC's.

A sawtooth signal of approximately 12.5 Hz is generated on both the A and B trigger levels. The sawtooth spans over the complete trigger level range, and the B value equals the A value multiplied by -1. This means that both signals can be added by using the oscilloscopes ADD TRACE function with the result of approximately zero.

- Check all signals on U63 to U67.

NOTE: U3, and U67 are located at the bottom side of the PCA, see Figure 5-20 and Figure 5-21.

- Trace the signal from U65 and U66 pin 6, to TRIGGER LEVEL A and B OUT, P111 pin 1 and 2 at the rear panel.
- Connect TRIGGER LEVEL A and B OUT to the oscilloscope and check the result by using the ADD TRACE function.

If you find any fault, continue with traditional troubleshooting techniques and replace defective circuits. See also Chapter 4, Circuit Descriptions, Trigger Level Circuits.

Figure 5-22 Typical voltages, Input Amplifier.

Input Amplifier (Functional Level 9)

• A and B Input Check

DC levels

- Switch on the counter.
- Press LOCAL/PRESET and ENTER.
- Select Time A-B.
- Deselect AUTO and set the trigger level to -1 V on both inputs.
- Select ATTENUATION A and B to x1.
- Select DC on both inputs.
- Measure the DC voltages according to Figure 5-22 and Table 5-7. Use the DMM with a 10 k Ω resistor in series with the test cable.

Test point	V _{DC}	V _{PP}

R, r	+3.3	—
S, s	-1.6	—
T, t	+4.2	—
U, u	-2.2	—
V, v	0	0.25
W, w	0	0.25
X, x	+2.7	0.5
Y, y	+1.2	—
Z, z	+2.6	0.5

Table 5-7 Typical voltages, Input Amplifier.

AC levels

- Connect a 1000 Hz sine wave signal with an amplitude of 1 V_{p-p} to Input A.
- Set the input amplitude to 1 V_{p-p}.
- Measure the AC-levels according to Figure 5-22 and Table 5-7. Use the oscilloscope and a 10 M Ω probe.
- Trace the signal from V23 pin E and V29 pin E to PROBE COMP VIEW A and B OUT, P25 pin 5 and 4 at the rear panel.

If you find any fault, continue with traditional troubleshooting techniques and replace defective circuits. See also Chapter 4, CIRCUIT DESCRIPTIONS, Input Amplifiers A and B.

• Prescaler 1.3 GHz, PM 9621

In all measurements you should use TP4 as ground.

Figure 5-23 Test points, 1.3 GHz prescaler.

Sensitivity Check

- Connect the signal generator to the HF input of the counter.
- Check the "Correct sensitivity and counting" levels according to Figure 5-24 to find out which part may have caused the fault. If everything seems all right, the fault is probably caused by the base unit.

Figure 5-24 Sensitivity and Counting levels.

DC-voltages

- Use a DMM to measure the DC-levels according to Table 5-8.

Test point	Measured voltage
IC1 pin 1	≈ 0.9 V
IC1 pin 5	≈ 3.1 V
TS1 pin b	≈ 0.9 V
TS1 pin c	≈ 3.1 V
TS2 pin e	≈ 2.3 V
IC2 pin 2,3	≈ 1.5 V
IC2 pin 6,7	≈ 4.5 V
TS5;c	≈ 4.5 V
TS6;c	≈ 4.5 V
BU7 pin 4	≈ 4.7 V
TP3	≈ 0.57 V

Table 5-8 DC voltages, PM 9621.

- Connect the signal generator to the HF input of the counter.
- Set the input frequency to 100 MHz and set the amplitude to -15 dBm, (40 mVRMS).
- Connect the oscilloscope to BU7 pin 4.
- Verify that the amplitude is 800 mV p-p and that the period time is 2.56 μ s, (frequency 390 kHz). The DC level should be 3.8 V. If everything seems all right the fault is probably caused by the base unit.
- Connect the DMM to TP3 and TP4 (GND).
- Disconnect the input signal.
- Check that the DC voltage drops \approx 200 mV.

If this last measurement is OK, you can skip the Overvoltage Protection Control.

Overvoltage Protection Control

- Connect the signal generator to the HF input of the counter.
- Set the input frequency to 100 MHz, and set the amplitude to 13 dBm, (1 VRMS).
- Check the DC voltages according to 0.

Test point	Measured voltage	Comment
TP1	-100 ± 50 mV	Correct
TP1	$\approx +300$ mV	GR3 faulty
TP1	≈ -300 mV	GR4 faulty
TP2	-220 ± 100 mV	Correct
TP2	≈ -400 mV	GR11 faulty
TP1 & TP2	$\approx \pm 50$ mV	Short circuit in one of GR3, GR4 or GR11

Table 5-9 DC voltages, Overvoltage protection control, PM 9621.

- Connect the DMM to IC2 pin 2.
- Check that the DC voltage is \approx 300 mV.
- Check that the amplitude at IC1 pin 1 is one third of the amplitude at BU1.
- Check that the amplitude at IC1 pin 5 is \approx 300 mVp-p.
- Check that the amplitude at TS1 collector and TS2 emitter is \approx 500 mVp-p.

Level Detector Control

- Disconnect the signal generator from the counter.
- Check the level detector according to the table below.
- Connect the signal generator to the HF input of the counter.
- Set the input frequency to 100 MHz and the amplitude to 13 dBm, (1 VRMS).
- Check the level detector according to Table 5-10.

Test point	Without input signal	With input signal
GR7, C16	≈ 320 mV	≈ 10 mV
IC3 pin 3	≈ 570 mV	≈ 370 mV
IC3 pin 1, 6	≈ 2.2 V	< 0.1 V
IC3 pin 5	≈ 2.07 V	≈ 2.1 V
IC3 pin 7	< 0.8 V	≈ 4.4 V
TS8;b	≈ 4.9 V	≈ 4.2 V
BU7 pin 4	≈ 4.7 V	≈ 3.8 V

Table 5-10 DC voltages, Level detector, PM 9621.

Divider and Differential Stage Control

- Connect the oscilloscope to IC2 pins 6 and 7.
- Check that the amplitude is 800 mVp-p and that the period time is 2.56 μ s, (frequency 390 kHz). The DC level is 4.5 V.
- Connect the oscilloscope to TS3;b and TS4;b.
- Check that the amplitude is 800 mVp-p and that the period time is 2.56 μ s, (frequency 390 kHz). The DC level is 3.8 V.
- Connect the oscilloscope to TS5;c and TS6;c.
- Check that the amplitude is 800 mVp-p and that the period time is 2.56 μ s, (frequency 390 kHz). The DC level is 4.5 V.

Signal Measurement

- Connect the signal generator to the HF input of the counter.
- Connect the Y-input of the oscilloscope to TP3 and TP4 (GND).
- Connect the X-input of the oscilloscope to the horizontal output of the generator.
- Set the frequency range of the generator to 70-1300 MHz.
- Set the amplitude to -15 dBm, (40 mVRMS).
- Figure 5-25 shows the typical frequency curve of the prescaler.

Figure 5-25 Typical Frequency Curve PM9621.

- **Prescaler 2.7 GHz, PM 9624**

See Chapter 2, Performance Check, for verification.

Figure 5-26 Specified and typical sensitivity of input C with option PM 9624.

This prescaler cannot be repaired in a local workshop. It must be sent to a Fluke Service Center, who will transfer the prescaler to the factory for repair.

- **Prescaler 4.2 GHz, PM 9625B**

See Chapter 2, Performance Check, for verification.

Figure 5-27 Specified and typical sensitivity of input C with option PM 9625B.

This prescaler cannot be repaired in a local workshop. It must be sent to a Fluke Service Center, who will transfer the prescaler to the factory for repair.

- **Prescaler 4.5 GHz, PM 9625**

See Chapter 2, Performance Check, for verification.

Figure 5-29 Specified and typical sensitivity of input C with option PM 9625.

This prescaler cannot be repaired in a local workshop. It must be sent to a Fluke Service Center, who will transfer the prescaler to the factory for repair.

GPIB interface and Analog output (Functional Level 10)

Figure 5-28 Component layout, GPIB interface.

- Set the oscilloscope to 2 V/div and 10 ms/div.
- Run the Analog out 1 test, Test 10.

The µ-controller generates a pulse width modulated signal with a variable duty cycle. This PWW signal is converted by U34 to a sawtooth signal of approximately 20 Hz. U77 makes a DC voltage in the range 0 to 4.98 V of the sawtooth and feeds it to the analog output on the GPIB interface.

NOTE: U34, and U77 are located at the bottom side of the main PCA.

Trace the signal from U6 pin 39 on the main board to ANALOG OUT, J3 at the rear panel.

- Use P5 on the main board to trigger the oscilloscope.
- Run the ANALOG OUT 2 test, Test 11.
- The analog output now outputs a DC voltage that can be controlled by pressing the UP/DOWN keys.

0 = min value = 0 V

255 = max value = 4.98 V

- Connect an IBM PC or compatible, equipped with a PM 2201, GPIB interface or equivalent and its software, to the interface in the counter.
 - Insert the floppy disc labeled: Test and Calibration program for PM 6681. This test program is included in this Service manual.
 - Change to the drive where the test floppy is inserted.
 - Type GPIBTST and press enter to start to program.
- All instructions needed to run the program are supplied by the program itself.

NOTE: This test program does not test the analog output.

If you find any fault, continue with traditional troubleshooting techniques and replace defective circuits. See also Chapter 4, Circuit Descriptions, GPIB-Interface.

Safety Inspection and Test After Repair

General Directives

After repair in the primary circuits, make sure that you have not reduced the creepage distances and clearances. Before soldering, component pins must be bent on the solder side of the board. Replace insulating guards and plates.

Safety Components

Components in the primary circuits are important to the safety of the instrument and may only be replaced by components obtained from your local Fluke organization.

Check the Protective Ground Connection

Visually check the correct connection and condition and measure the resistance between the protective lead at the plug and the cabinet. The resistance must not be more than 0.5Ω . During measurement, the power cord should be moved. Any variations in resistance shows a defect.

Chapter 6

Calibration Adjustments

Introduction

Required Test Equipment

Type	Performance	Model No
DMM	5 full digits	PM 2534
Counter		PM 6669
DC source	5 V	Philips PE 1536
LF-synthesizer	10 kHz/20 Vpp	PM 5193 S
PC incl. CRC GPIB interface		**
Interpolator Calibration program		** (incl. in this manual)
Pulse Generator	125 MHz/2ns	PM 5786 (PM 5781**)
Signal generator	1300 MHz	6062A
Sampling oscilloscope		
FET probe		
Passive probe	10:1 <1.5 pF	PM 8926
Terminator	50 Ω/1 W	PM9585 or Y9103
Attenuator	20 dB	PM 9591 or Y9102
Power splitter	50 Ω/4W	PM 9584
T-piece		PM 9067; Y9107
10 MHz reference	1×10^{-7}	PM 9691
10 MHz reference	1×10^{-9}	PM 6681R or PM6685R*
BNC-BNC cables		
Insulated screwdriver		

Table 6-1 Required Test Equipment.

* For adjustment of Oven Oscillators only.

** PM 5781 required for Interpolator calibration adjustment.

Preparation

WARNING: Live parts and accessible terminals which can be dangerous to life are always exposed inside the unit when it is connected to the line power. Use extreme caution when handling, testing, or adjusting the counter.

Before beginning the calibration adjustments, power up the instrument and leave it on for at least 60 minutes to let it reach normal operating temperature.

Power Supply

CAUTION: If you adjust the +5V trimmer you have to adjust the complete instrument.

• Setup

- Connect the counter to the line power.
- Switch on the counter.
- Press PRESET, then press ENTER.

Figure 6-1 Test points and trimmer for the Power Supply.

• Adjustment

- Connect the DMM to test points L10 and GND6, see Figure 6-1.
- Adjust the +5V trim potentiometer R446=+5V adjust in the power supply using an insulated screwdriver, until the DMM reads $+5.000 \pm 0.001$ V.
- Check that the voltage at the test points X15=+5 and GND6 is $+5.00 \pm 0.05$ V.
- Check that the unregulated voltage from the power supply at test points X11=+15 and GND6 is about +18 V.
- Check that the unregulated voltage from the power supply at test points X12=-9 and GND6 is about -8 V.

Crystal Oscillators

16 MHz Oscillator

- Connect the counter via a probe to the test point P7 and GND5.
- Check that the measured frequency is $8 \text{ MHz} \pm 100 \text{ Hz}$.

External Reference Input Multiplier

Figure 6-2 Trimmers for the 10 MHz Frequency Multiplier.

• Setup

PM 6681	Function	EXT REF
LF synthesizer	Amplitude	1 V Sinus
	Frequency	1 MHz
Sampling Oscilloscope	Time	200 $\mu\text{s}/\text{div}$.
	Setting: A	1 V/div., 50 Ω , DC

Table 6-2 10 MHz Multiplier setup.

- Connect the LF synthesizer to the REFERENCE INPUT at the rear of the PM 6681 via a 50Ω attenuator.
- Connect the Sampling Oscilloscope to the test point X20. (Use a FET probe).
- Adjust C356 to maximum amplitude. See Figure 6-2.

Standard Oscillator

Figure 6-3 Trimmers for the reference oscillator frequency.

• Setup

- Connect the counter to the 10 MHz OUTput at the rear of the PM 6681.
- The adjustment should preferably be made at an ambient temperature of $+25^\circ\text{C}$.

• Adjustment

- Adjust C114=STD OSC ADJ until the counter reads 10 MHz ± 2 Hz. See Figure 6-3.

100 MHz Frequency Multiplier

Figure 6-4 Trimmers for the 100 MHz Frequency Multiplier.

• Setup

PM 6681	Function	EXT REF
LF synthesizer	Amplitude	1 V Sinus
	Frequency	10 MHz
Sampling Oscilloscope	Time Setting: A	200 μ s/div. 1 V/div., 50 Ω , DC

Table 6-3 100 MHz Multiplier setup.

- Connect the Sampling Oscilloscopes trigger input to the 10 MHz OUT at the rear of the counter.
- Connect the Sampling Oscilloscope via a probe to the test point X19. See Figure 6-4.
- Adjust the capacitor C346 to 10 cycles/100 ns.
- Connect the Sampling Oscilloscope to the test point X18.
- Adjust the capacitors C347, C348, and C351 to maximum amplitude.
- Adjust the capacitors C346, C347, C348, and C351 to maximum amplitude in sequence until maximum amplitude is reached at X18.
- Connect the LF-synthesizer with a 10 MHz reference to the EXT-REF input of the counter.
- Select EXT REF.
- Change the input frequency ± 1 kHz.

If the amplitude is varying with the frequency the capacitors C347 and C348 has to be adjusted again. Begin to adjust the amplitude at 10 MHz ± 1 kHz.

Eventually C346 has to be adjusted as well.

Optional TCXO, PM 9678B

• Setup

- Connect the counter to the line power.
- Switch on the counter.
- Press PRESET, then press ENTER.
- Connect the 10 MHz reference to the A input of the counter.

The adjustment should preferably be made at an ambient temperature of +23°C.

• Adjustment

- Adjust the trim capacitor C1 on the optional oscillator until the counter reads 10 MHz ± 1 Hz. See Figure 6-5.

Optional Oven Oscillators, PM 9690 and PM 9691

• Setup

- Connect the counter to the line power.
- Switch on the counter.
- Press PRESET, then press ENTER.

Oscilloscope	Time	100ns/div.
--------------	------	------------

Table 6-4 Optional oscillator setup.

Figure 6-5 Trimmers for the optional oscillator frequency.

The adjustment should preferably be made at an ambient temperature of +23°C.

The oscillator must have been operating continuously for 48 hours before any adjustment is made.

- Connect the 10 MHz reference signal of the PM 668XR to EXT TRIG of the oscilloscope.
- Connect the 10 MHz out of the counter to the A-input of the oscilloscope.

• Adjustment

- Adjust the FINE trimmer on the oscillator until the waveform moves with a velocity of a maximum of 1 div/10s (0.1 Hz). See Figure 6-5.

If the adjustment is too narrow, proceed as follows:

- Set the FINE trimmer fully clockwise.
- Remove the two screws holding the oscillator's text plate.
- Use a pair of tweezers to remove the small plastic cylinder beneath the text plate.
- Connect an external counter to the 10 MHz OUT socket of the counter to be adjusted.
- Adjust the COURSE trimmer until the display reads 10000003 Hz on the external counter.
- Adjust the FINE trimmer until the display reads 10000000 Hz on the external counter.
- Reinstall the plastic cylinder and the text plate to the oscillator.

Adjust the FINE trimmer on the oscillator until the waveform moves with a velocity of a maximum of 1 div/10s (0.1 Hz).

Interpolator

NOTE: This adjustment has only to be performed if the timer/counter has lost its calibration information, (that is if the counter displays ZCaL . LOST Z, or if you have made any repairs in the interpolator circuits.

• Setup

- Connect the Pulse Generators output A to the input A of PM 6681.
- Connect the LF-synthesizers to the EXT INput of the Pulse Generator.
- Connect a 10 MHz (aging at least 10^{-8}) reference to the reference input of PM 6681 and the synthesizer.
- Connect the the GPIB connectors of the PM 6681, LF-synthesizer, and Pulse Generator to the PC;s GPIB card.

NOTE: The timer/counter, synthesizer, and the pulse generator should not have the same GPIB address, none of them should have address 0 or 30, (this is used by the PC).

• Adjustment

- Turn on the timer/counter, the synthesizer, and the pulse generator.

If the timer/counter shows a flashing ZCaL . LOST Z, press the preset button until this message disappears.

NOTE: The calibration should be done when the counter has been on for more than 20 minutes. If you start the calibration program before 20 minutes has passed since power on, the program will wait the required time.

- Insert the discette labeled "Test and Calibration program for PM 6681", into the 3 1/2" disc-drive on the PC.
- Start the calibration program from the DOS command prompt with the command "[path]CALVER81". Supposing you use the A: drive, this might look like:

C:\>a:CALVER81

The first displayed screen on the PC will show you the needed hardware and software to run the calibration program. It also shows the bus addresses the different instrument must be set to.

- Press ENTER when you are ready to begin the calibration.
- Now you shall enter the different GPIB addresses for the instruments involved.
- Type the serial number of the counter under test and press ENTER.

Now you will be asked if you want to calibrate the counter. The calibration will take between 20 and 60 minutes to complete. (If you answer no (n) on this question you will be asked if you want to verify the calibration of the interpolators. The verification will only take a few minutes.)

The program will attempt calibration using a number of different input signals, and will check the result, choosing for the final calibration the best result achieved.

After the calibration is completed the best calibration parameter will be stored in the counters battery backed up RAM. A printout of the calibration result will also be sent to LPT1 of the PC. The printout will look as shown below:

NOTE: Even though the specification says 50ps the system does not accept more han 40ps. This limit is set to ensure that the spec should be fulfilled over the whole temperature range.

```

```

All of these values are results of standard deviation measurements of pulse widths in the range 4 to 50 ns (in 2 ns steps). For each pulse width 2000 samples are taken.

Input Amplifier

- Setup

Figure 6-7 Test points and trimmers for the Input amplifiers.

Step Response

- Setup

PM 6681	Function	TIME A-B
	Input A+B	50 Ω/DC/Manual trigger levels
	Attenuation	X1
Pulse Generator	Amplitude	4 V
	Pulse Period	1 ms
Sampling Oscilloscope	Time	100 μs/div.
	Setting: A	10 mV/div. (10:1 <1.5 pF passive probe),DC

Table 6-5 Step Answer setup.

NOTE: The adjustment must be made at an ambient temperature of +25°C.

- Connect the Pulse Generator to the A input of the counter (B input) via the T-piece.

NOTE: It is of most importance that the output pulses from the pulse generator does not tilt more than 0.1% of the pulse amplitude.

- Connect the channel A of the oscilloscope via a probe to the other output from the T-piece, see Figure 6-6.
- Adjust the amplitude of the oscilloscope until the pulse is 8 divisions high.
- Adjust the probe until the pulse is absolutely flat.

- Adjustment

Channel A

- Connect the probe to test point X2.
- Adjust R167=LIN A and C40=1X A until the signal is absolutely flat.

Channel B

- Connect the probe to test point X4.
- Adjust R168=LIN B and C38=1X B until the signal is absolutely flat.

- Setup

PM 6681	Function	VOLT A MAX/MIN
	Input A+B	50 Ω/DC/Manual trigger level
	Measuring time	80 ns
	Attenuation	1X
Sampling Oscilloscope	Amplitude	10 mV/div on channel B (10:1 <1.5 pF passive probe)
	Time	5 μs/div
Pulse Generator	Amplitude	4.8 V
	Pulse Period	100 μs
	Rise/Fall time	3 ns
	Pulse shape	Symmetrical/positive pulse

Table 6-6 10X Attenuator setup.

- Press AUX MENU.
- Select Auto Lo and press ENTER.
- Type 1000 on the numeric keypad and press ENTER.
- Connect CLOCK OUT from the pulse generator to TRIGG IN on the oscilloscope.
- Connect the Pulse generator to the A input via a T-piece.
- Connect the oscilloscope to the other end of the T-piece and check that the base- and top line of the pulse is absolutely flat.

• Fine adjustment

At the first hand the X1 attenuation should be best adjusted.

NOTE: It is of most importance that the screwdriver does not contain any kind of magnetic material.

1X Attenuator channel A

NOTE: Four digits on the display.

- Connect the probe to test point X2. For trimmers and test points see Figure 6-6.
- Adjust C40=1X A until the tilt of the top line is 0.3 V. See Figure 6-7.

Figure 6-6 The tilt of the top line is 0.3 V.

- Remove the probe.
- Read the counters display.
- Adjust C40=1X A until the displayed value has increased 5 to 10 mV.

10X Attenuator channel A

NOTE: Three digits on the display.

- Select 10X on input A.
- Connect the probe to test point X2. For trimmers and testpoints see Figure 6-6.
- Adjust C1=10X A and C432 until best possible pulse, without any overshoots or undershoots.
- Adjust C1=10X A until the tilt of the top line is 0.3 V. See Figure 6-7.
- Remove the probe.
- Read the counters display.
- Adjust C40=10X A until the displayed value has increased 10 to 30 mV.
- Shift between 1X and 10X and check that the displayed value does not differ more than ± 50 mV.

1X Attenuator channel B

NOTE: Four digits on the display.

- Connect the probe to test point X4. For trimmers and testpoints see Figure 6-6.
- Adjust C38=1X B until the tilt of the top line is 0.3 V. See Figure 6-7.
- Remove the probe.
- Read the counters display.
- Adjust C38=1X B until the displayed value has increased 5 to 10 mV.

10X Attenuator channel B

NOTE: Three digits on the display.

- Select 10X on input B.
- Connect the probe to test point X4. For trimmers and testpoints see Figure 6-6.
- Adjust C9=10X B and C436 until best possible pulse, without any overshoots or undershoots.
- Adjust C9=10X B until the tilt of the top line is 0.3 V. See Figure 6-7.
- Remove the probe.
- Read the counters display.
- Adjust C38=10X B until the displayed value has increased 10 to 30 mV.
- Shift between 1X and 10X and check that the displayed value does not differ more than ± 50 mV.

Sensitivity

• Setup

PM 6681	Function	DUTY F A
	Input A+B	50 Ω /AC/Manual trigger levels
	Attenuation	1X
	Trigger levels	0 V
LF synthesizer	Measuring time	100 ms
	Frequency	1 kHz Sinus or triangle
Oscilloscope	Amplitud	500 mV pp before the attenuator
	Amplitude	50 mV/div (10:1 probe)
	Time	200 μ s/div

Table 6-7 Sensitivity setup.

- Connect the LF synthesizer via an 20dB attenuator to input A.
- Check with the oscilloscope that the signal at the input of the counter is clean and real sinus or triangle.
- Adjust the resistor R18=OFFSET A until the counter shows 0.500 ± 0.001 .
- Connect the LF synthesizer via the 20dB attenuator to input B.
- Press SWAP.
- Adjust the resistor R44=OFFSET B until the counter shows 0.500 ± 0.001 .

Trigger Levels

• Setup

PM 6681	Function	FREQ A
	Input A+B	1M Ω /DC/Manual trigger levels
	Attenuation	1X
	Trigger levels	5 V
	Measuring time	80 ns
DC source	Amplitude	5.0 V ± 50 mV.

Table 6-8 Trigger Levels setup.

• Adjustment

• Channel A

- Connect a stable DC voltage to the A input of the counter via a T-piece. See Figure 6-8.
 - Connect a DMM to the other end of the T-piece.
- NOTE: Use coaxial cables to avoid signal interference.*

Figure 6-9 Connect a stable DC voltage to the A input of the counter.

- Press AUX MENU.
 - Select AU . CODES and press ENTER.
 - Type 23.1 on the numeric keypad and press ENTER.
 - Set the measuring time to 80 ns.
 - Press STAT and select MEAN.
 - Type 10 on the numeric keypad and press ENTER.
 - Select 1X attenuation.
- NOTE: If it is not possible to select 1X attenuation R308 has to be adjusted.*
- Adjust R308=FULL SCALE A until the counter displays the same value as the DMM ± 1 mV.

• Common

- Select COMMON.
- Press SWAP.
- Adjust R311=FULL SCALE COMMON B until the counter displays the same value as the DMM ± 1 mV.

• Channel B

- Move the the DC source and the DMM to the B input.
- Deselect COMMON and SWAP.
- Adjust R331=FULL SCALE B until the counter displays the same value as the DMM ± 1 mV.

Analog output

• Setup

PM 6681	Input A	50 Ω /AC/Manual trigger levels
	Attenuation	X1
LF synthesizer	Amplitude	1 Vpp*
	Frequency	1000.01 Hz square wave

Table 6-9 GPIB interface setup.

* The output amplitude mentioned is the set amplitude; it is only valid for an open output of the synthesizer.

• Adjustment

- Connect the DMM to the BNC connector ANALOG OUT- put at rhe rear of the PM 6681.
- Activate the analog output.
- Select AUX MENU.
- Press SELECT/SET until the display reads ANALOG OUT .
- Press ENTER.
- Press SELECT/SET to select ON.
- Press ENTER.
- Type 0.001 ENTER via the keyboard.
- Connect the LF synthesizer to the A input of the counter. The counter should read 1000.0xxxxx Hz.
- Adjust the trimmer ZERO=R384 (see Figure 6-9) until the output voltage is 0 V ± 1 mV.

Figure 6-8 Trimmers for the Analog output.

- Set the LF synthesizer to 999.90 Hz/1 Vpp square wave. The counter should read 999.9xxxxx Hz.
- Adjust the trimmer FULL SCALE=R381 (see Figure 6-9) until the output voltage is 4.980 V ± 3 mV.
- Set the LF synthesizer to 100.0 Hz/1 Vpp square wave. The counter should read 100.0xxxxx Hz.
- Check that the output voltage is 500 mV ± 5 mV.

1.3 GHz HF-input, PM 9621

Figure 6-11 Test points and trimmers for the 1.3 GHz HF-input.

NOTE: Before beginning any adjustments, the HF input must have been in operation for at least one minute, to let it reach normal operating temperature.

• Setup

- Connect the counter to the line power.
- Switch on the counter.
- Press PRESET, then press ENTER.

PM 6681	Input C	FREQ C
Signal generator	Frequency	900 ± 25 MHz
	Amplitude	7.5 ± 0.5 mV RMS

Table 6-10 1.3 GHz HF-input setup.

- Connect the signal generator to the HF-input.

• Adjustment

- Turn the potentiometer R30 fully counterclockwise. See Figure 6-11.
- Check that the GATE indicator stops blinking.
- Turn R30 slowly clockwise until the GATE indicator starts blinking.

The input frequency, 900 ± 25 MHz will now be displayed.

2.7 GHz HF-input, PM 9624

Figure 6-10 Test points and trimmers for the 2.7 GHz HF-input.

NOTE: Before beginning any adjustments, the HF input must have been in operation for at least one minute, to let it reach normal operating temperature.

• Setup

- Connect the counter to the line power.
- Switch on the counter.
- Press PRESET, then press ENTER.
- Connect the signal generator to the HF-input.

PM 6681	Input C	FREQ C
Signal generator	Frequency	1000 ± 25 MHz
	Amplitude	5.9 ± 0.5 mV RMS

Table 6-11 HF-input setup.

• Adjustment

- Turn the potentiometer R61 fully counterclockwise. See Figure 6-10.
- Check that the GATE indicator stops blinking.
- Turn R61 slowly clockwise until the GATE indicator starts blinking.

The input frequency, 1000 ± 25 MHz shall now be displayed.

4.2 GHz HF-input, PM 9625B

It is not possible to make any adjustments to the PM 9625B.

Therefore, if you suspect any faults, we recommend you to send the unit to the factory for repair.

Contact your local Philips or FLUKE service center.

To verify the 4.2 GHz HF input a sweep frequency synthesizer, (Wiltron 6717B-20) is needed.

4.5 GHz HF-input, PM 9625

It is not possible to make any adjustments to the PM 9625. Therefore, if you suspect any faults, we recommend you to send the unit to the factory for repair.

Contact your local Philips or FLUKE service center.

To verify the 4.5 GHz HF input a sweep frequency synthesizer, (Wiltron 6717B-20) is needed.

Chapter 7

Replacement Parts

Introduction

Standard Parts

Electrical and mechanical replacement parts can be obtained through your local Philips or Fluke organization or representative. However, many of the standard components can be obtained from other local suppliers. Before purchasing or ordering replacements parts, check the parts list for value, tolerance, rating, and description.

If the value of the physical component differs from what is described in the parts list, you should always replace the part with the same value as originally mounted.

NOTE: Physical size and shape of a component may affect the performance of the instrument, particularly at high frequencies. Always use direct replacements unless it is known that a substitute will not degrade the performance of the instrument.

Special Parts

In addition to standard electronic components, the following special components are used:

- Components that are manufactured or selected by Philips to meet specific performance requirements.
- Components that are important for the safety of the instrument.

Both type of components may be replaced only by components obtained through your local Philips or Fluke organization.

The abovementioned parts are 'Recommended Replacement Parts' and are marked with an 'R' in the \star column of the parts list.

Components marked with a 'P' in the \star column are 'Production items' not kept in replacement parts stock. These items can be ordered, but the delivery time is longer than for normal replacement parts.

Chapter 8

Schematic Diagrams

How to Read the Diagrams

This chapter contains circuit diagrams and component layout information.

Each diagram contains a list of the ICs used. These lists indicates the connections that are not shown in the diagram, such as GND and supply voltages.

Signals

The signals in the counter are named after what they do, e.g. LEAD-EDGE is used as control current to the leading edge circuits.

Two different types of arrows are used to mark references for continued connection somewhere else in the diagram.

A1 This arrow is used if the reference is directed to a point located on the same page.

/1.A1 This arrow is used if the reference is directed to a point located on another page. The example means that the point is on sheet 1, coordinate A1.

Colored Areas

The coloured areas in the diagrams represent following functions:

= Integrated circuits

= Trim points, test points or jumpers

= Connectors

Circuit Symbols

The diagrams are computer drawn. The symbols conform to IEC standards. These symbols are designed to be logical and easy to read.

The component number is written above the symbol.

Inside the symbol at the top is an abbreviated description of the circuit's function.

Pin numbers are written outside the symbol and, if the circuit is complex, the pin functions are written inside.

A small circle on a pin indicates that the input/output inverts the signal.

The component name is written below the symbol.

The signal flow through the circuit is always from left to right.

Resistors, Capacitors, Diodes, Transistors and Other Components.

These components are similar to the old-fashioned, hand-drawn symbols. They have their component number above and their value or component name below.

A resistor contained in a resistor network has a frame drawn around it and one of the pin numbers is written to the left or below it.

Component Numbers

Letters	Components
B	Crystals and crystal filters
C	Capacitors
D	Diodes
F	Fuses
G	Batteries
J	Jumpers and connectors
K	Relays
L	Coils
P	Connectors
R	Resistors
U	IC;s
V	Transistors
X	Test points

The numbers are only sequential numbers.

This page is intentionally left blank.

Chapter 9

Appendix

How to Replace Surface Mounted Devices

Most of the components in this instrument are mounted on the surface of the board instead of through holes in the board. These components are not hard to replace but they require another technique. If you do not have special SMD desoldering equipment, follow the instructions below:

Figure 9-1 Heat the leads and push a thin aluminum sheet between the leads and the pca.

Figure 9-2 When removed, clean the pads with desoldering braid..

Figure 9-3 Place solder on the pad.

Figure 9-4 Attach the IC to the pad with solder.

Figure 9-5 Solder all leads with plenty of solder, don't worry about short-circuits at this stage.

Figure 9-6 Remove excessive solder with desoldering braid..

Figure 9-7 Use a strong magnifying glass to make sure there are no short/circuits or unsoldered leads.

Electrostatic discharge

Almost all modern components have extremely thin conductors and metal oxide layers. If these layers are exposed to electrostatic discharge they will break down or perhaps even worse, be damaged in a way that inevitably will cause a breakdown later on. The Electro-Static Discharge sensitivity of MOS and CMOS semiconductors have been known quite a while, but nowadays bipolar semiconductors and even precision resistors are ESD sensitive. Consider therefore all components, pc-boards and sub-assemblies as sensitive to electrostatic discharge. The text below explains how you can minimize the risk of damage or destroying these devices by being aware of the problems, and learning how to handle these components.

ESD sensitive options are packed in conductive containers marked with this symbol.

- *Never open the container unless you are at an ESD protected work station.*
- *Use a wrist strap grounded via a high resistance.*
- *Use a grounded work mat on your workbench.*
- *Never let your clothes come in contact with ESD sensitive equipment even when you are wearing a grounded wrist strap.*
- *Never touch the component leads.*
- *Never touch open connectors.*
- *Use ESD-safe packing materials.*
- *Use the packing material only once.*
- *Keep paper and nonconductive plastics etc. away from your workbench. These may block the discharge path to ground.*

Glossary

A	
ASIC	Application Specific Integrated Circuit
C	
Calibration Adjustments	How to restore an instrument to perform in agreement with its specifications
CSA	Canadian Safety Association safety standard.
G	
GaAs	A technique to make very fast ICs using Gallium Arsenide substrat.
GPIB	General Purpose Instrumentation Bus used for interconnecting several measuring instruments to a common controller.
I	
I^2C -bus	An internal address- and data bus for communication between microcontroller, measuring logic, and options.
IEC 1010-1	International Electrical Commission safety standard.
L	
LSI	Large Scale Intergrated circuit
O	
OCXO	Oven Controlled X-tal Oscillator
P	
PCA	Printed Circuit Assembly
Performance Check	A procedure to check that the instrument is functionally operational and performs to its specification. Must not require opening of cabinet. If the instrument passes the check it is considered as calibrated.
PWM	Pulse Width Modulated
U	
UCXO	Un-Compensated X-tal Oscillator (standard)

Unit 1

The main printed-circuit board (Unit 1) has recently been redesigned due to obsolescence of a number of integrated circuits. Designations found in circuit descriptions, schematic diagrams and parts lists in the first eight chapters refer to the original design. The functional descriptions are correct on the whole, if you make a few substitutions. A new set of schematic diagrams and a new replacement parts list are included in this chapter.

- Instruments having serial numbers >784919 belong to the new generation.
- The model PM6681R/676/AF has only been produced with the new Unit 1 board, so the serial number is irrelevant in this case.

Model PM6681R

Rubidium Timebase

Introduction

A rubidium timebase (atomic clock reference) is now available in the Model PM6681R Timer/Counter/Analyzer. This oscillator cannot be retrofitted. Due to the power requirements, an additional built-in power supply is needed. It is located on the same board as the distribution amplifiers for the six extra reference outputs included in this instrument.

Performance Check

The general rules in Chapter 2 apply, but observe the additional instructions below.

NOTE: To fully test the accuracy of the PM6681R, access to an extremely high stability reference signal is needed, for example a Cesium Atomic Reference or a transmitted signal from a nationally or internationally traceable source. Additionally the instrument has to be stabilized for a period of one month.

The PM6681R has an UNLOCKED/STANDBY LED. When the LED is lit the Rubidium time base is still in its warm-up phase and is not yet stabilized.

■ Test procedure

- Connect the counter to the line power.
- Check that the UNLOCKED/STANDBY LED is lit.
- Turn on the Timer/Counter
- Check that the UNLOCKED/STANDBY LED is switched off within 5 minutes after connection to line power.
- Connect a 10 MHz reference signal to input A of the counter.
- Select FREQUENCY A measurement.
- Select 1 s measuring time.
- Check that the displayed frequency is $10.00000000 \text{ MHz} \pm 1 \text{ LSD}$ < 6 minutes after connection to line power.

NOTE: The rubidium timebase unit must be sent to a Fluke service center for repair. Follow the exchange procedure.

Calibration and Adjustment

NOTE: Before adjusting the oscillator, the timer/counter must have been continuously connected to the ac power line for at least 24 hours.

Required test equipment

Type	Uncertainty	Model
10 MHz reference	$<2 \times 10^{-11}$	Cesium / GPS
Timer/Counter		PM6681
GPIB controller		PC+GPIB+TimeView

■ Setup

- Connect the 10 MHz reference to the REFERENCE IN connector on the rear panel of the timer/counter and make sure that External Reference is selected on the front panel.
- Connect one of the 10 MHz outputs on the rear panel of the PM6681R – the Device Under Test (DUT) – to Input A of the timer/counter.

■ Calibration measurement

- Set the measurement time of the timer/counter to 10 s.
- Select MATH (K^*X+L) and set a negative offset of 10 MHz ($L = -10E6$).
- Select STAT (statistics), N=100, and MEAN.
- Press RESTART. After approx. 17 minutes the mean value over 100 readings is displayed.

NOTE: If a GPS receiver is used as a reference, change number of samples N in the STAT menu to 8640 (instead of 100) to enable a frequency mean value over 24 h (instead of 17 min). GPS receivers have an excellent long-term stability (24 h) but can be quite unstable over shorter periods.

■ Adjustment criteria

If the display reading does not exceed 0.5 mHz ($0.5 \times 10^{-3} \text{ Hz}$), no adjustment is required.

■ Adjustment procedure

- Switch off statistics (STAT OFF) in the timer/counter.
- Remove the seal sticker from the front panel of the DUT (below ‘Ref Adj’ to the left of the PRESET button).
- Adjust the potentiometer behind the seal until the display of the timer/counter shows $0.5 \times 10^{-3} \text{ Hz}$ or less.
- Repeat the calibration measurement described above to verify the adjustment.

- Check that the value is stable over time (>30 min). TimeView is an excellent tool for viewing frequency stability over time.
- Attach a new calibration seal sticker so that it covers the hole in the front panel.

Fig. 9-8 Location of the Rubidium timebase and its power supply & distribution amplifiers including the wiring between these units.

OCXO Range Extended

New OCXOs

Oven-Controlled Oscillators, PM9691 & PM9692

The PM9691 is adjusted to $10 \text{ MHz} \pm 0.2 \text{ Hz}$ when manufactured, the PM9692 to $10 \text{ MHz} \pm 0.05 \text{ Hz}$, so there is no need to adjust the frequency directly after installation.

These oscillators, like any oscillator, change frequency because of aging. Use the table in the Operators Manual, Chapter 10, to calculate when calibration is due. The complete specifications can be found in the same manual, Chapter 11.

Required test equipment

Instrument	Required specification	Model
Counter with Rubidium Reference	$10 \text{ MHz} \pm 0.01 \text{ Hz}$ (Uncertainty $\leq 1 \times 10^{-9}$)	PM6681R/ PM6685R

Table 9-1

■ Setup

- Connect the counter to the line power.
 - Switch on the counter.
 - Set the counter to default settings (preset).
- Make the adjustment at an ambient temperature of $+23^\circ\text{C}$, if possible. The oscillator must have been operating continuously for 48 hours before an adjustment.
- Connect the 10 MHz OUT socket of the counter to be adjusted (rear panel) to the Input A of the PM6681R/PM6685R.
 - Set up the PM6681R/PM6685R:
 - Measuring time = 0.5 s
 - 50Ω input impedance
 - Frequency A measurements

■ Adjustment

The oscillator has a voltage controlled adjustment range. This range is divided into five fixed steps set via DIP switches, and a trimmer to fine-tune the control voltage.

Normally the range of the trimmer should be sufficient to compensate for the aging that occurs during at least two years of operation.

Fine adjustment

- Adjust the trimmer to better than $10 \text{ MHz} \pm 0.2 \text{ Hz}$ (PM9691) or $10 \text{ MHz} \pm 0.05 \text{ Hz}$ (PM9692), i.e. ± 20 resp. ± 5 in the last two digits on the PM6681R/PM6685R display.

- If this adjustment is OK, reassemble the counter.

Coarse adjustment

Make this adjustment only if the trimmer range is insufficient to adjust the oscillator.

- Remove the tape from the DIP-switch.
- Adjust the trimmer to its mid position (about 12 turns from either end position).
- Read the frequency on the PM6681R/PM6685R.
(Nominal 10.000000 MHz)
 - If the frequency is too low, set the DIP-switches to the next higher voltage range.
 - If the frequency is too high, set the DIP-switches to the next lower voltage range.

Trimmer range (V)	DIP switch number (1 = on, 0 = off)							
	1	2	3	4	5	6	7	8
2.6 - 3.4	0	0	0	1	0	0	0	0
3.2 - 3.9	0	1	0	1	1	0	0	0
3.5 - 4.3	1	0	0	1	1	0	0	0
4.0 - 4.7	1	0	1	1	1	1	0	0
4.1 - 5.0	1	0	1	0	1	1	1	0

Table 9-2 Coarse adjustment by means of DIP switches.

- Check that the new trimmer range is about $\pm 2 \text{ Hz}$ around 10 MHz.

Adjust the trimmer according to ‘Fine adjustment’ above.

Fig. 9-9 Adjusting the optional oscillator frequency.

This page is intentionally left blank.

Option PM9671B

Introduction

This optional reference output unit replaces the extra 5x10 MHz + 1x5 MHz outputs of the PM6681R and offers more frequencies (1x0.1 MHz, 1x1 MHz, 1x5 MHz and 3x10 MHz with higher output level (1 VRMS versus 0.6 VRMS). The standard 10 MHz, 0.6 VRMS output of PM6681R is not affected.

Performance Check

Connect an oscilloscope to the outputs marked I, J, K, L, M and N and check the frequencies (0.1, 1, 5, 10, 10 and 10 MHz), the waveform (sinusoidal) and the level (>1 VRMS).

Adjustments

No adjustments can be made. The output frequencies are locked to the internal/external timebase, depending on the source selected via the front panel or by means of a GPIB command. The default timebase source is the built-in reference oscillator.
